#### Abstract

Early child-bearing and high fertility still persist especially among the poor, despite the more than two decades of family planning program implementation in the Philippines. Using an evaluation framework that links inputs, outputs, utilization of outputs and outcomes, the paper analyzed the impact of the different components of the Philippine Population Management Program (PPMP), namely: family planning and responsible parenthood, reproductive health, adolescent health and youth development, and integration of population and development. On the inputs and output side, the paper utilized the expenditures on the different components of the program for the years 1998 and 2000 presented in Racelis and Herrin (2003). Data from the several rounds of the national demographic survey, family planning survey and maternal and child health survey were used to generate utilization and outcomes indicators. The paper highlights the inadequate institutional and financial support as the primary cause of the population program's ineffectual performance.

Keywords: population, reproductive health, family planning, population and development (POPDEV), population expenditures, PPMP

#### An Evaluation of the Philippine Population Management Program (PPMP)

Alejandro N. Herrin, Aniceto C. Orbeta, Jr., Iris Acejo, Janet Cuenca and Fatima del Prado

August 2003

#### A Framework for PPMP Monitoring and Evaluation

The assessment of the evaluability of the PPMP during Phase I lead to the formulation of a framework for evaluation the PPMP at the policy level (as opposed to operational) by looking at the interrelationships among outputs, utilization, and outcomes. Evaluability questions/assessments under each objective/strategy were likewise provided to serve as guidelines in the actual evaluation (see Herrin, 2002).

Figure 1 shows a framework linking inputs, outputs, utilization of outputs and outcomes for each objectives/goal of the program. Each policy objective is translated into a strategy, which consists of a number of activities. Activities are defined in terms of inputs and outputs. Inputs refer to the resources expended to produce the outputs. Outputs refer to the goods and services provided. Before outputs can produce the desired outcomes it must be because the intended beneficiaries utilized them. Finally, the utilization of outputs are expected to produce impacts on the outcomes. In each of these stages, indicators are identified. This framework was applied in the analyzing each of the objectives of the program using available data.

Figure 1. Framework for PPMP Monitoring and Evaluation

The PPMP has four major policy objectives/strategies:

- 1. To help couples/parents achieve their desired family size within the context of responsible parenthood/responsible parenthood and family planning (RH/FP);
- 2. To reduce maternal mortality, infant mortality and child mortality through improved reproductive health/reproductive health (RH);
- 3. To reduce the incidence of teenage pregnancy, incidence of early marriage, and the incidence of other reproductive health problems/adolescent health and youth development (AHYD); and
- 4. To contribute to policies that will assist government to achieve a favorable balance between population distribution, economic activities, and the environment/integration of population and development planning (POPDEV).

Instead of enumerating all the types of services and activities available, another way of measuring outputs is by determining how much was spent for the provision of various services and implementation of various activities. Recently, Racelis and Herrin (2003) estimated PPMP expenditures by source of financing for the years 1998 and 2000. The expenditures are organized according to the broad components of the PPMP, namely: (1) Reproductive Health/Family Planning, which consists of family planning and other reproductive health services; (2) Adolescent Health and Youth Development t; (3) Population and Development Integration; and (4) support activities such as policymaking, data collection, and resource mobilization. Summary tables are shown below.

	199				
Uses of Expenditures	Amount (in million	Percent	Amount (in million	Percent	
	pesos)		pesos)		
1. Reproductive health/family planning (RH/FP)	12,423.6	89.8	14,166.0	83.8	
1.1 FP services and counseling	1,162.5	8.4	1,401.2	8.3	
1.2 RH services and counseling (excluding FP)	9,203.1	66.5	11,157.6	66.0	
1.3-1.6 Others (capacity building, advocacy, research)	2,058.0	14.9	1,607.2	9.5	
2. Adolescent health and youth development (AHYD)	23.3	0.2	17.3	0.1

Table 1: PPMP Expenditures by Use of Expenditures, 1998 and 2000

Source: Racelis and Herrin (2003)

In year 2000, the program spent 17 billion pesos up from 14 billion pesos in 1998. Of that amount, 83.8% was spent for reproductive health, very little for adolescent health and youth development (0.1%) and population and development integration (0.2%). This gives us an idea of where efforts have been concentrated. Within the broad RH/FP category of expenditures is the expenditures for family planning and counseling services, which accounted for 8.3% of total PPMP expenditures and 10% of RH/FP expenditures. Reproductive health services (excluding FP) on the other hand constituted 66% of total PPMP expenditures.<sup>1</sup>

The total PPMP expenditures from all sources represent about 15% of total health expenditures in both 1998 and 2000. The total health expenditures based on the National Health Accounts are 93.5 billion pesos in 1998 and 113.5 billion pesos in 2000.

	199	8	2000		
Source of financing	Amount (in million pesos)	Percent	Amount (in million pesos)	Percent	
National government	2,892.4	20.9	4,242.1	25.1	
Foreign-assisted projects	1,469.2	10.6	1,247.6	7.4	
Local government	2,725.4	19.7	3,567.6	21.1	
Health Insurance (PhilHealth)	633.7	4.6	1,497.9	8.9	
Donors and CAs	823.0	6.0	431.4	2.6	
NGOs	235.8	1.7	495.9	2.9	
Households	5,049.7	36.5	5,430.7	32.1	
Total	13,829.3	100.0	16,913.2	100.0	

Table 2: PPMP Expenditures by Source of Financing, 1998 and 2000

Source: Racelis and Herrin (2003)

In terms of sources of the 2000 PPMP expenditures, 33% of total expenditures came from national and foreign-assisted projects, 21% from local governments, 9% from PhilHealth, 3% Donors and their cooperating agencies (CAs), 3% from NGOs, and 32% from households (Table 2). Between 1998 and 2000, both the national government and the local government assumed a greater role in the financing PPMP expenditures from 40% in 1998 to 46% in 2000. PhilHealth, which reimburses expenses on some family planning services like vasectomy and ligation, also had an increasing contribution in the total PPMP expenditures as did NGOs. On the other hand, donors and foreign-assisted

<sup>&</sup>lt;sup>1</sup> In 1998, DOH issued A.O.-1A, which defined the ten elements of reproductive health as follows: (1) family planning, (2) maternal and child health and nutrition, (3) prevention and management of abortion complications, (4) prevention and treatment of reproductive tract infections including STDs and HIV/AIDS, (5) breast and reproductive tract cancers and other gynecological conditions, (6) adolescent reproductive health, (7) education and counseling on sexuality and sexual health (mainly for adolescents also), (8) men's reproductive health, (9) violence against women and children, and (10) prevention and treatment of infertility and sexual disorders.

projects had declining contributions into the total PPMP expenditures. Donors, in particular reduced their direct spending by half (6% to 2.6%). Even their indirect spending (through transfers to final spending units), which amounted to 13% of total PPMP expenditures in 1998 was reduced to 6.4% in 2000.

In 2000, national government expenditures (including foreign-assisted projects) for PPMP represented 23% of total health expenditures, while the corresponding percentage for local government, health insurance and household are 16%, 19% and 12%, respectively.

Below we evaluate each of these PPMP strategies according to the framework shown in Figure 1. Given limited data, we view the time relationships between outputs, utilization and outcomes rather broadly. Data on outputs, principally expenditures of specific services or activities are available for 1998 and 2000. We expect that the effect of these on utilization variables will be both immediate as well as medium-term. Most data on utilization variables are available from 1998 to 2002, with some available for 1993 or earlier to provide some baseline or past trend. The effect of utilization variables on outcome variables can also be immediate or medium-term. However, data on outcome variables are available only for 1993 and 1998. In some cases we show prior trends to suggest that the outcome variable under consideration has been changing slowly, and, given utilization levels observed in 2000 and 2002, is not likely to change much up to the more recent period. Note that it was in 1997 that POPCOM issued the first PPMP Directional Plan 1998-2003, and in 2000 it issued the PPMP Directional Plan 2001-2004. Hence, the period 1998-2002 would be the appropriate periods to examine the above relationships.

#### **Responsible Parenthood and Family Planning**

A description of the inputs, outputs, intermediate and final outcomes under this program strategy is presented in Table 3 below. The objective is "to help couples/parents achieve their desired family size within the context of responsible parenthood." The strategy to achieve this objective called "Responsible Parenthood and Family Planning" (RP/FP). The primary outputs are family planning services of a wide range of methods available in various outlets. Aside from the FP services, other outputs include capacity building or training, advocacy, and organizational support. The utilization indicators are contraceptive prevalence rates broken down by method and by source of supply as well as the extent of unmet need for contraceptive supplies and services. A indicator of the attainment of this objective is the total fertility rate. Achievement of desired family size is determined by equality of actual fertility and wanted fertility, or zero unwanted fertility.

Table 3: Responsible parenthood and family planning (RP/FP): objective/strategy, outputs, utilization, and outcomes

Objective/Strategy	Outputs	Utilization/ Intermediate Outcomes	Outcome
Objective 1: To help couples/parents to achieve their desired family size within the context of responsible parenthood. Strategy 1: Responsible Parenthood and Family Planning (RP/FP)	<ul> <li>Family planning services availability</li> <li>Advocacy/ communication program</li> <li>Training programs</li> <li>Organizational support</li> </ul>	<ul> <li>Contraceptive prevalence rate: total and by method mix</li> <li>Unmet need for contraception</li> </ul>	• Total fertility rate: wanted and unwanted

### Output indicators

Tables 4a and 4b show the percent distribution of total PPMP expenditures by strategy/activity and by source of expenditures in 1998 and 2000, respectively. In 2000, for example, the data show that that out of every hundred pesos spent on the PPMP, 8 pesos was spent for family planning services and counseling. Of this, 70 centavos came

Source of basic data: Racelis and Herrin (2003)

from the national government, 1.80 pesos came from local government units, 1.50 pesos came from donors, and 50 centavos from NGOs. In contrast, the households contributed nearly half (3.70 pesos) of the total amount. The total government share is only 2.50 pesos. Hence, the main source of the small portion of the PPMP expenditures spent on family planning is still the households. The relatively large contribution of donors in family planning expenditures reflects the fact that they are the only source of contraceptive supplies. The national government has not allocated money for the purchase of contraceptives for distribution to various public health facilities.

Another indicator of service availability is where people obtain their supplies for modern FP methods. From 1993-2002, close to 70 percent of total supply have been obtained from public facilities (Table 5). Private sector share is relatively small although increasing, with a large part of the increase due to pharmacies. Only at most 0.5% obtains modern family planning services/supplies from NGOs. Thus NGOs still constitute a very small segment in service delivery network. (A large part of their expenditures are in

Sources: 1993 National Demographic Survey (NDS), 1998 National Demographic and Health Survey (NDHS), and Family Planning Surveys, various years.

advocacy, research and capacity-building activities.) The contraceptives available in the public sector have so far been provided donors. Therefore, without the assistance from donors and if no government funding is set aside for contraceptives, the private for-profit sector will be the only source of modern methods potentially creating a 70% gap in the

supply of modern contraceptives. President Arroyo was quoted as saying that in the event that donors reduce or stop their assistance on contraceptives, she expects the NGOs to fill up the slack rather than the government.<sup>2</sup> It is not likely that the NGOs can fill up the huge gap considering they spent only about 6% in 2000 for family planning services (0.5/8.3, in Table 4b).

Table 6 shows the differences in contraceptive rates by method of contraception between the poor and non-poor. Overall in both 2000 and 2002, the use of modern methods by the poor is 20%-25% lower than the non-poor. The prevalence of using pills, which are relatively available in most public health facilities, is very similar for the poor and non-poor. For female sterilization, on the other hand, which is only available in hospitals, the prevalence among the rich is more than double that of the poor. This lends support to the hypothesis that lack of access to specific methods of choice is a primary reason for the disparity of contraceptive prevalence between the poor and non-poor.

Type of Method	200	0 FPS	2002 FPS

Table 6: Percent of Currently Married Women by Method, Poor and Non-Poor

Source: NSO, Family Planning Surveys, 2000 and 2002.

Data on contraceptive prevalence rates by income groups show that the contraceptive prevalence rate among the poorest group (first quintile) is only 20% compared to the richest group (Table 7). It may be hypothesized that relatively more poor people do not practice family planning because they want more children. The data do show that the poor have a higher total fertility rate than the rich: 6.5 births per woman among the poor to 2.1 births per woman among the rich. Some of the difference, however, may be

<sup>&</sup>lt;sup>2</sup> Rina Jimenez-David, "GMA up close", *Philippine Daily Inquirer*, July 7, 2002.

attributed to the relatively lack of access to contraceptive services by the poor. We return to this issue later.

	Poorest	Second	Third	Fourth	Richest	Mean
Total fertility rate	6.5	4.7	3.6	2.9	2.1	3.7
Age-specific fertility rate (15-19)	130	90	32	29	12	46.0

Service utilization is also measured in terms of unmet need. In year 2002, about 20 percent of women have unmet needs. Unmet needs are categorized into two types: (1) those who said they do not want anymore children but are not practicing contraception: 14% in 1993 and 10% in 2002; and (2) those who say they want to space their children but are not practicing contraception: 12% in 1993 and 11% in 2002 (Table 8). Note also that the percentage with unmet need, especially for limiting purposes is higher among rural women than urban women, and among those with lower education than those with college education, suggesting that part of the observed higher fertility among poor women is due to the inability to practice contraception of their choice.

#### Utilization/intermediate outcomes

A major indicator of an intermediate outcome of family planning efforts is contraceptive prevalence. Data from the National Demographic Surveys (NDS) and National

Demographic and Health Survey (NDHS) show slow increase in the use of modern methods (Figure 2). Data from the Family Planning Surveys (FPS) show similar slow increases for the recent period 1995-2002 (Figure 3). Overall, the use of modern methods in the country is still about 33 percent in year 2002. In contrast, in 2002 Thailand's contraceptive prevalence rate for modern methods is 70%, Indonesia 55%, and Vietnam 56% (UNESCAP, 2003). The Philippines' relatively low contraceptive prevalence rate largely explains why the country's fertility rate is still very high compared to these other countries.

Source: National Demographic Surveys 1968-1993, and National Demographic and Health Survey 1998

Source: NSO, Family Planning Survey, various years.

### Outcomes

Compared to neighboring countries, the country's total fertility rate (TFR) had declined very slowly (Figure 4). For example, Thailand, Indonesia and Vietnam had almost the

same fertility as the Philippines in the 1950s at more than 6.0 births per thousand women. However, because of faster fertility decline engendered in part by a consistent population policy of fertility reduction, these countries have achieved or close to achieving replacement fertility. In 2002, Thailand's TFR was 1.8 births per thousand women, and Indonesia and Vietnam's TFR was 2.3 births per woman (UNESCAP, 2003). In contrast, the Philippines' TFR estimated by UNESCAP is still 3.2 births per thousand in 2002.

Source: National Demographic Surveys 1968-1993, and National Demographic and Health Survey 1998

Fertility is higher among poor than non-poor as shown Table 7. In 1998, the poorest quintile had a total fertility rate of 6.5 births per thousand women compared to only 2.1 births per thousand women for the richest quintile. Moreover, among the young, ages 15-19, the fertility rate is more than 10 time higher among the poor than among the rich. Such differential is likely to have been significantly reduced in the current period in view of lesser efforts to promote modern contraception by the national government. This suggests that an important group for advocacy and service focus would continue to be not only the poor, but more especially the young among the poor.

Another important indicator of fertility outcomes is whether actual fertility is wanted or not. The difference indicates the inability of couples to achieve their desired fertility. In the 1993 and 1998 national demographic surveys, women were asked whether each of the children born during the last five years preceding the survey was wanted then, wanted later or during that time they wanted no more children. Wanted fertility then is the fertility of women during the five years preceding the survey who wanted additional children then. The difference between their actual fertility and their wanted fertility is called unwanted fertility.

In the 1993 survey, wanted fertility is 2.9 while actual fertility is 4.7 or a difference of 1.8 children (Table 9). In the 1998 survey, the difference had gone down but this is still one child higher than wanted fertility. This difference in unwanted fertility is larger in rural

areas and among less educated women. For example in 1998, the difference in actual and wanted fertility among urban women is only 0.7 birth per 1,000 women compared to 1.4 births per 1,000 women among rural women. Similarly the difference among those with only elementary education is 1.7 births per 1,000 women compared to only 0.4 birth per 1,000 women among those with college education. This differential, which is reflective of the relative lack of access to family planning services, has likely persisted to the current period since there was no significant efforts to reach out the poor with respect to their family planning service needs in the past two years.

	199	3 NDS	1998 NDHS

Table 9: Total and wanted fertility rates, 1993 and 1998

Sources: NSO, 1993 National Demographic Survey and 1998 National Demographic and Health Survey

Unwanted births are likely to be births among mothers who are too young (less than 18), or too old (more than 35), who gave birth too soon (less than 24 months), or who have given birth when they already have too many children. Births to mothers having these characteristics are said to be high risk births in the sense that babies born by such mothers have higher risk of infant mortality. Table 10 shows data on such high-risk fertility behavior. In the table, single-risk fertility means mothers possesses any one of the above risks, while multiple-risk means having a combination of these factors, e.g., high parity and closely spaced birth intervals. The risk ratio means the likelihood of dying among children born of high risk mothers compared to those children born under the no-risk category. In 1993 and 1998, more than half of births are in high-risk categories involving more than two-thirds of all women who bore children during that time. This is a very high proportion of potential infant deaths arising from high risk fertility.

Disk Catagowy	Births in la preceding	Percentage of Currently	
Kisk Category	Percentage of Births	Risk Ratio	Married Women
1993 NDS

#### Summary

Compared to other countries in the region, the Philippine performance is one of slow fertility decline. This is due to a larger extent to unwanted fertility or the inability to achieve desired fertility among the poor, rather than solely due to high desired fertility. In turn, high unwanted fertility, which is related to high risk births, slows down further reduction in infant mortality. The use of modern contraceptive methods remains low compared to other countries. This is appears to be due more to lack of access to high quality and preferred methods than to the lack of demand, especially among the poor. In 1998 NDHS, for example, 62% of currently married women said they wanted no more children. The percentage among women with only elementary education was 72% compared 53% among women with college education.

This slow increase in contraceptive prevalence of modern methods, and the consequent slow fertility decline, may be traced back to the lack of consistency in policy to reduce fertility and promote FP, especially the modern and effective "artificial" methods. This lack of consistency has been documented earlier (Herrin, 2003). The lack of sustained effort arising from such lack of consistency is reflected in the government allocation of resources to FP services and supplies. In 2000, households finance close to half of total expenditures for direct FP services, while donors and NGOs contributed another 24%. Moreover, thus far the national government has not allocated resources for the purchase of contraceptives for distribution to public health outlets. Past and current contraceptive supplies have provided largely by donors and so some extent by NGOs.

### **Reproductive Health (RH)**

Table 11 shows the outputs, utilization and outcome indicators for the reproductive objective/strategy of the PPMP. The policy objectives include reduction of maternal, infant and child mortality. The strategy is improved reproductive health. The outputs include reproductive health services, as well as advocacy, training and organizational support. The intermediate outcomes are the utilization rates of RH services. The final outcomes are measured in terms of maternal, infant and child mortality.

Objective/ Strategy	Outputs	Utilization/ Intermediate Outcomes	Outcomes
Objective 2: To reduce maternal mortality, infant mortality and child mortality through improved reproductive health. Strategy 2: Reproductive Health/Family Planning Program (RH/FP)	<ul> <li>Reproductive health services availability</li> <li>Advocacy/ communication program</li> <li>Training programs</li> <li>Organizational support indicators</li> </ul>	• Utilization (coverage) rates of RH services	<ul> <li>Maternal mortality</li> <li>Infant mortality</li> <li>Child mortality</li> </ul>

Table 11: Reproductive health: outputs, utilization and outcomes

### Outputs

As revealed in Tables 4a and 4b, a large part of the expenditures for the PPMP is in fact in reproductive health services. In both 1998 and 2000, out of every 100 pesos expenditures for the PPMP, 66 pesos were spent on reproductive health services and counseling. Households and government almost equally share total spending on reproductive health services. Households spent 42%, while national and local governments spent 45%. The rest was paid for by PhilHealth and NGOs.

Reproductive health services include the 10 elements adopted by the Department of Health in 1998 (DOH, AO-1A, January 15, 1998). These include: (1) family planning; (2) maternal and child health and nutrition; (3) prevention and management of abortion complications; (4) prevention and treatment of reproductive tract infections including STDs and HIV/AIDS; (5) breast and reproductive tract cancers and other gynecological conditions; (6) adolescent reproductive health; (7) education and counseling on sexuality

and sexual health; (8) men's reproductive health; (9) violence against women and children; and (10) prevention and treatment of infertility and sexual disorders.

#### Utilization/intermediate outcomes

Except for family planning, maternal and child health, and violence against women and children, there are no regular data compiled on the other elements of reproductive health. However, there are virtually no data on the other components besides birth and child related outcomes. Thus, in terms of intermediate outcomes, we present data on pre-natal care, birth attendance, and post-natal care.

A high percentage (more than 90%) of pregnant women goes for pre-natal care, and most of the women visit medically trained health providers. However, the percentage receiving specific services is not as high. In 2000, only 79% received iron tablets, 65% receive iodine capsules, and 70% received tetanus toxoid injections. The percentages did not improve significant in 2001 and 2002 (Table 12).

	MCHS					
	1999	2000	2001	2002		
Percent who received prenatal care	94.2	93.9	94.6	94.1		
Percentage who received from:						
Doctor	44.7	45.5	41.3	45.4		
Nurse/midwife	49.4	49.9	54.0	50.3		
Traditional birth attendant/hilot	5.8	4.5	4.5	4.2		
Others	0.1	*	0.2	0.1		
Percent who received iron tablet/capsule	78.6	78.5	81.1	82.2		
Percent who received iodine capsule	58.9	64.5	64.4	n.d.		
Percent who received tetanus toxoid injection	69.9	70.4	71.4	70.4		

Table 12: Percent of pregnant women who received pre-natal care, by type of health provider, and by type of services, 1999-2002

Source: NSO, Maternal and Child Health Survey (MCHS), various years.

Although pre-natal care utilization is high, there is still significant variation among income groups. The 1998 NDHS reveals that among the poorest quintile pre-natal visits to medically-trained providers, which include both doctors and midwives/nurses, was only 70% compared to almost 100% among the richest quintile (Table 13). For the poorest, the main medically trained providers are midwives while for the richest, the main providers are doctors. Evidently, the richest, have more access to doctors than the poor. Finally, in terms of the number of pre-natal visits, only 76% of the poorest made

two or more pre-natal visits compared to 95% among the richest. The variations across income groups indicate that the poor are not as adequately reached by maternal health programs as the rich.

	Poorest	Second	Third	Fourth	Richest	Mean
To doctor	10.1	23.7	45.4	64.7	82.3	38.5
To midwife/nurse	61.3	59.7	47.9	30.2	15.2	48.2
Medically-trained provider	71.5	83.4	93.3	94.9	97.5	85.7
2+ visits	75.9	83.9	91.7	92.9	95.4	86.1

Table 13: Prenatal care visits (%): 1998 NDHS

Gwatkin, et al. (2000)

In terms of delivery attendance, Table 14 shows the lack of access by the poor to doctors: only 13% of children of the poor were delivered by doctors compared to 46% of children of the non-poor. In contrast, 63% of the children of the poor were delivered by hilots compared to only 22 % for the non-poor.

Table 14: Percent of children 0-59 months by type of delivery attendant

	1993 NDS	1998 NDHS	2002 FPS
All children			
Doctor	26.0	30.9	33.2
Midwife/Nurse	26.8	25.5	27.2
Hilot	45.3	41.3	38.5
Poor			
Doctor			13.0
Midwife/Nurse			22.1
Hilot			63.0
Non-poor			
Doctor			46.2
Midwife/Nurse			30.6
Hilot			22.7

Sources: 1993 National Demographic Survey (NDS), 1998 National Demographic and Health Survey (NDHS), and 2000 Family Planning Survey (FPS)

A similar story is revealed in the 1998 NDHS. Only 21 percent of the deliveries among the poorest quintile were attended by a medically-trained provider compared to 92% among the richest quintile (Table 15). Moreover, the poor have less access to public facilities. Only 7% of poorest deliver their babies in public facilities compared to 26% for the richest. Thus, government subsidies to public facilities are captured more by the rich than the poor.

	Poorest	Second	Third	Fourth	Richest	Mean
By a doctor	7.1	16.5	35.7	50.2	75.8	30.9
By a midwife/ nurse	14.1	29.3	37.1	33.8	16.0	25.5
By a Medically-trained provider	21.2	45.9	72.8	83.9	91.9	56.4
In a public facility	7.1	16.0	28.7	29.3	26.3	19.5
In a private facility	1.6	4.1	11.8	25.5	52.5	14.8
At home	91.0	79.4	59.4	44.8	21.2	65.5

Table 15: Delivery attendance (%): 1998 NDHS

Source: Gwatkin, et al. (2000)

Although a high percentage of women obtains prenatal care, the proportion of them having postnatal care is relatively low (Table 16). In 2000, only 60% visited a health attendant for postnatal care, and although the percentage is higher in 2002, the percentage is only 71%. Unlike in prenatal care, where women tend to visit trained medical providers,

Table 16: Postnatal care, 1999-2002

		MC	CHS	
	1999	2000	2001	2002
Percent who received postnatal care	63.1	60.0	64.5	71.0
Percentage who received from:				
Doctor	47.5	51.7	47.1	n.a.
Nurse/midwife	37.5	37.1	39.9	n.a.
Traditional birth attendant/hilot	14.9	10.8	12.8	n.a.
Type of service				
Abdominal exam	55.3	55.4	58.4	56.9
Breast Exam	36.2	36.4	37.1	36.3
Internal Exam	30.2	34.6	30.2	35.9
Family Planning Advice	40.8	40.3	42.2	40.6
Breastfeeding Advice	58.2	56.1	56.3	55.2
Baby Care Advice	67.1	64.2	67.5	62.6
Check-up of Baby	77.8	77.9	79.5	78.2

Source: NSO, Maternal and Child Survey, various years.

in the case of postnatal care, relatively large percentages (more than 10%) seek out traditional birth attendants. For those who went for postnatal visit, relatively low proportions obtained specific reproductive health services. For example, only about a third was given breast examination, also a third was given internal examination, and only about 40% were provided with family planning advice.

#### Outcomes

Outcomes of poor maternal and child care include high maternal and infant mortality. There is very limited data on maternal mortality. The maternal mortality ratio, that is, the number of maternal deaths per 100,000 births, estimated from the 1993 NDS was 213 for the period 1980-86 and 209 for the period 1987-93. In the 1998 NDHS, maternal mortality ratio was estimated at 172 for the period 1993-1998. This ratio of 172 for the period is much higher than in neighboring countries. For examples, the maternal mortality ratios for the period 1990-1998 were 44 for Thailand, 39 for Malaysia, 20 ofr South Korea, and 6 for Singapore (World Bank, 2001). Only Indonesia had a much higher maternal mortality ratio than the Philippines. Moreover, in 1998, maternal deaths accounted for approximately 14 percent of all deaths in women aged 15-49.

The infant mortality rate, that is, the number of infant deaths per 1,000 live births, has likewise declined slowly in the Philippines compared to neighboring countries such as Thailand and South Korea. In 2002, the infant mortality rate in the Philippines was estimated at 30 infant deaths per 1,000 livebirths compared 20 in Thailand and 6 in South Korea (UNESCAP 2003).

Not only has infant mortality declined slowly, there exist large difference in infant mortality among the poor and non-poor. Data from the 1998 NDHS show that infant mortality rate 49 per 1,000 livebirths among the poorest and only 21 per 1,000 livebirths among the richest (Table 17). Thus, the children of the poorest quintile have more than twice as high probability of dying than the children of the richest quintile. On under 5 mortality, the difference is again more than half. This difference in the infant mortality rates between the rich and the poor represents what has been achieved in 20 years of decline in our infant mortality record. Thus, another way of looking at this difference is that the poorest quintile is 20 years behind in terms of infant mortality compared to the richest quintile.

	Poorest	Second	Third	Fourth	Richest	Mean
Infant mortality rate	48.8	39.2	33.7	24.9	20.9	36.0
Under 5 mortality rate	79.8	60.5	49.7	33.4	29.2	54.9

Table 17: Infant and child mortality: 1998 NDHS

Source: Gwatkin, et al. (2000)

#### Summary

Our data show high maternal mortality and high infant mortality compared to other countries in the region. This might be partly explained by low utilization of maternal and child care services from trained medical providers among the poor. Subsidized public sector health facilities are used by the better-off than by the poor. While the maternal and child care services are in place, public sector delivery are now the main responsibility of local government units, that either lack local resources or give low priority to health services. Households finance close to half of direct reproductive health care expenditures.

### Adolescent Health and Youth Development (AHYD)

Table 18 shows the outputs, utilization and outcome indicators for the Adolescent Health and Youth Development (AHYD) strategy of the PPMP. The objective is "to reduce the incidence of teenage pregnancy, incidence of early marriage, and the incidence of other reproductive health problems." The outputs are education services and counseling, advocacy, capacity building, and organizational support.

Objective/Strategy	Outputs	Utilization/Interme diate Outcomes	Outcomes
<ul> <li>Objective 3:</li> <li>To reduce the incidence of teenage pregnancy, incidence of early marriage, and the incidence of other reproductive health problems.</li> <li>Strategy 3:</li> <li>To ensure that adolescents are provided with appropriate information, knowledge, education and services on population and reproductive health. (AHYP)</li> </ul>	<ul> <li>Education services and counseling</li> <li>Advocacy/com munication program.</li> <li>Training programs</li> <li>Organizational support</li> </ul>	<ul> <li>Attendance in education and counseling programs</li> <li>Coverage of advocacy and communication program</li> </ul>	<ul> <li>Age at marriage</li> <li>Pregnancy rate among teenagers and youth age 15- 19 and 20-24 years</li> <li>Fertility rate among teenagers and youth</li> <li>Indicators of reproductive health behavior and problems among the adolescent and youth (e.g.,STD, HIV/AIDS?)</li> </ul>

Table 18: Adolescent health and youth development: outputs, utilization and outcomes

### Outputs

As shown earlier in Tables 4a and 4b, the expenditures on AHYD is very small compared to the other PPMP components. Expenditures for AHYD amounted to 23 million pesos in 1998 and 17 million pesos in 2000, representing 0.02% and 0.01% of total PPMP expenditures, respectively. Expenditures by NGOs almost equal that of government in 1998, and almost double that of government in 2000. Government expenditures declined from 10.5 million pesos in 1998 to 6.2 million pesos in 2000.

#### Outcomes

There is very limited national level information on indicators of utilization of AHYD services and activities. Available information available relates to outcomes – mainly about fertility among the very young.

The age-specific fertility rates for the young, ages 15-19, show constant trend at about 50 births per 1,000 women ages 15-19 from 1973 to 1998 based on the series of national demographic surveys during that period. However, such average shows large differences by income class. Data shown earlier in Table 7 revealed very high fertility (130 births per 1,000) among the poorest compared to only 12 per 1,000 among the richest adolescents. This is indicative that the programs on adolescent health and youth development are not reaching the poorest.

<b>Background Characteristics</b>	1993 NDS	1998 NDHS
Age		
15	0.5	0.5
16	1.3	1.6
17	3.6	5.0
18	10.3	10.5
19	19.0	21.3
Residence		
Urban	4.8	4.7
Rural	8.9	10.8
Education		
No education	15.2	17.3
Elementary	13.5	15.9
High School	5.5	5.7
College or higher	1.8	4.5
Total	6.5	7.2

 Table 19. Teenagers Who Have Begun Childbearing, 1993 and 1998

Sources: 1993 National Demographic Survey (NDS) and 1998 National Demographic and Health Survey (NDHS)

Table 19 indicates that in 1993, 6.5 percent of teenagers have begun childbearing and it increased to 7.2 percent in 1998. It seems to be increasing by age from age 16 to 19. It is also higher in the rural compared to urban areas. Finally, it is higher among those with lower education than among those with higher education.

#### Summary

Our data show early childbearing and high fertility especially among the poor. Information is lacking on the utilization of AHYD services at the national level. There is very little spending on AHYD compared to total PPMP expenditures. Government expenditures have in fact declined by almost half in actual peso terms between 1998 and 2000 leaving NGOs to carry a larger part of the financing.

### **Population and Development (POPDEV)**

Table 20 presents the indicators of outputs, utilization and outcomes of the population and development component of the PPMP. The objective is "to contribute to policies that will assist government to achieve a favorable balance between population distribution, economic activities and the environment." The outputs include advocacy/IEC and training on POPDEV integration, research and conferences, technical assistance and supports and enforcement systems in place. The utilization indicators include trained planners; research and conferences held; regional, LGUs, migrants provided assistance. The outcomes include integration of POPDEV in local development plans; improved management of urban settlement systems, and balance growth of regional centers.

Like adolescent health and youth development, relatively fewer resources had been expended on POPDEV in 1998 and 2000. As revealed earlier, only 20 centavos is spent for POPDEV for every 100 pesos spent on the PPMP. Much of the work on POPDEV has occurred during the late 1980s and early 1990s.

Moreover, it is difficult to evaluate this component of the PPMP because many aspects cannot be properly evaluated. For example, consider the strategy of having an enforcement system in place, i.e., enforcement of environmental laws. The question is how do we know whether POPCOM or the population program, has enforced environmental laws? What would be the indicator? Would it be the number of policemen or forest guards that they have hired, or the number of apprehension by these people? Furthermore, some of the outcomes are too general that it is difficult to develop readily acceptable indicators of achievement, such as balanced growth of regional centers or improved management of urban centers. Hence, there are aspects in this component of the PPMP where it is difficult to say something definite, and where further conceptualization is needed (see Herrin 2002).

<b>Objective</b> /	Outputs	Utilization/	Outcomes
Strategy		Intermediate Outcomes	
Objective 4: To contribute to policies that will assist government to achieve a favorable balance between population distribution, economic activities, and the environment. Strategy 4: Integrate population variables, with emphasis on migration and urbanization, into development policies, plans and programs at all levels. (POPDEV)	<ul> <li>Advocacy/IEC program on POPDEV integration</li> <li>Training program on POPDEV integration.</li> <li>Program of research and conferences.</li> <li>Technical assistance program in place.</li> <li>Technical assistance in managing urban settlements in place.</li> <li>Technical and financial support to regional centers in place</li> <li>Support system in place (provision of dormitories and housing?)</li> <li>Technical and vocational education in place</li> <li>Enforcement system in place.</li> </ul>	<ul> <li>Trained planners in selected provinces and cities.</li> <li>Number of researches and conferences held.</li> <li>Number of LGUs receiving technical assistance.</li> <li>Number of regional centers receiving technical and financial support.</li> <li>Number of LGUS receiving technical assistance in managing urban settlements.</li> <li>Number of migrants provided dormitory and housing (?)</li> <li>Number of echnical and vocational education.</li> <li>Number of environmental law violations seen or handled.</li> </ul>	<ul> <li>Integration of POPDEV in local development plans</li> <li>Improved management of urban settlements (?)</li> <li>Rapid and balanced growth of regional growth centers (?)</li> </ul>

Table 20. Population and development: outputs, utilization and outcomes

### **Information Gaps**

The foregoing exercise revealed several information gaps that need to be addressed so that future monitoring and evaluation of the PPMP can be done much more adequately. While there is reasonably updated data on family planning use, source of supplies of modern methods, and fertility, mainly from regular national surveys, this is not the case for infant, child and maternal mortality, and outcomes data on youth. There is also very limited data on utilization and outcome indicators on the other elements of reproductive

health. Disaggregated data on utilization and outcomes by major social groups, e.g., poor vs. non-poor proved to be insightful, and therefore, more such information is needed. This is partly filled up by secondary analysis of the accumulated survey data that estimates values of utilization and outcome indicators by asset quintiles (see Orbeta, et al., 2003). Finally, there is a need for further development of indicators of utilization and outcomes for the AHYD and POPDEV components.
