German economy: strong employment growth, weak investment activity

By Ferdinand Fichtner, Karl Brenke, Marius Clemens, Simon Junker, Claus Michelsen, Thore Schlaak, and Kristina van Deuverden

The German economy's upward growth trend continues, with the economic output expected to increase by 1.4 percent this year with slightly overloaded capacities. Employment growth remains strong with the creation of 600,000 new jobs, which has in turn led to an increase in private consumption – one of the key growth drivers of the German economy. The higher inflation rates are dampening purchasing power, but they will subside later on in the forecast period. The high public budget surpluses will experience a sharp decline.

Investment, on the other hand, remains weak, partially due to the fact that Brexit and Trump are creating uncertainty for German exporters. Frictions in the financial markets that may arise as a result of the upcoming elections – in France and the Netherlands, for example – could present risks for the real economy.

The moderate upswing in the German economy continues, with an expected growth rate of 1.4 percent this year – which is higher than the 1.2 percent projected in DIW Berlin's December 2016 forecast. A key factor behind this adjustment was the revision of Germany's labor market data, which now appear to be more favorable than previously believed. After rather subdued development in the second half of 2016, the German economy has picked up momentum once again (Table 1), with present indicators suggesting powerful development for the first quarter of 2017. A growth rate of 1.7 percent is expected for 2018 (Table 2).

Later on in the forecast period, however, economic growth should lose some momentum (Figure) as changes to the major growth drivers – which include the refugee influx and the low energy prices – cause them to thus lose their influence, an effect that has already become noticeable over the past year. Wage development is moderate: employment growth remains strong and unemployment will continue to decline significantly, from 5.7 percent this year to 5.3 percent in 2018. The growing worker shortage should gradually lead to higher wage agreements. But given the large numbers of immigrants – especially from within the EU – and the increasing labor market participation of older people, no substantial wage increases are expected for the forecast period.

In stark contrast to the favorable employment growth, business investment remains weak. Companies are working hard to fill jobs – especially in light of the impending labor market shortage – but they remain cautious when it comes to investment expenditure. This is mainly due to the high degree of economic policy-related uncertainty that has been triggered by the Trump administration, the Brexit decision, and the forthcoming elections in some major EU countries. These factors have made it more difficult to make plans, and businesses are thus backing away from higher and longer-term expenditures, further hindering investment activity. A significant portion of companies' surpluses are instead being invested abroad; this is also reflected in the excessively high cur-

rent account surplus, which is actually expected to drop below eight percent this year (the rising import costs also play a role here). It will, however, remain well above the EU's target rate of 6 percent.

Investment activity will, however, be stimulated somewhat by foreign trade, which will remain rather robust

throughout the forecast period: the emerging countries in particular should continue to exhibit strong growth. That energy prices are no longer declining is leading to high inflation in many places, which is dampening households' purchasing power. However, these high inflation rates are likely to decline somewhat over the next few

months, since the recent rise in energy prices has already come to a standstill.

The high public budget surplus is on the decline, due first and foremost to the lower tax revenues and the fact that expenditures have been increasing. In structural terms – that is, adjusted for cyclical influences – the total public budgets will be in the red next year, since the capacities will be slightly overloaded. This was also the case last year. This slight overutilization will subside later on in the forecast period.

Germany's economic development is facing substantial risks, most of which are arising from the international economic environment. The political developments over the past year suggest that threats to international cooperation and economic integration are increasing, and parties that are opposed to integration may receive considerable support in the upcoming elections of some key EU

countries. If this leads to the implementation of measures that are detrimental when it comes to protectionism or economic cooperation, it will hinder the growth of Germany's export-oriented economy.

Yet even apart from that, the European economy remains fragile: the banking sectors and public finances in some countries are still plagued with problems, and many areas are still grappling with high unemployment rates and weak household purchasing power. All of these problems reinforce one another and could end up having a more substantial impact on Europe's economic development than forecasted here; this is also true if the outcomes of the upcoming elections create tensions in the financial markets and lead to turmoil in the banking system, public finances, and the real economy. The resulting economic downturn in the euro area will also impact the Germany economy.
