World economy gaining momentum, risks remain high

By Ferdinand Fichtner, Guido Baldi, Christian Dreger, Hella Engerer, Stefan Gebauer, Michael Hachula, Robert Lange, and Malte Rieth

The world economy continues on its upward growth path, with global production expected to grow by 3.7 percent this year and slightly more than that in 2018. The economies in both the developed and the emerging countries are gaining momentum. Solid output growth is expected for the U.S. and euro area over the forecast period; China's growth rates remain high, though they are declining somewhat; and Russia is coming out of its recession. Private consumption is driving growth in the developed countries, but the rise in inflation – which is due to higher energy prices – is expected to slow down consumption growth a bit. The global increase in prices is likely to also lead to a slightly more restrictive monetary policy overall. A number of economic policy-related risks – not least among them, the protectionism – could have a negative impact on the world economy, in particular on investment activity.

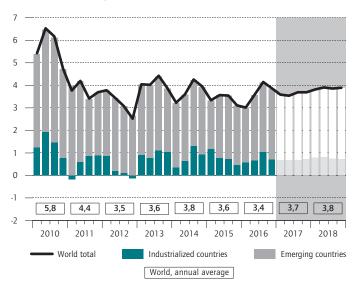

The global economic upswing in the first half of 2016 continued in the final quarter of the past year – and the improved growth dynamic is expected to persist throughout the forecast period (Figure). For the most part, the economies in both the developed and emerging countries are picking up momentum. A number of early indicators suggest that solid growth in the U.S. and the euro area will continue; this is also the case for Japan, though the upward momentum will cool off somewhat there. Among the emerging countries, China's economy is expanding in accordance with the new official growth targets, and the slump feared by some observers one year ago is unlikely to materialize, with a steady momentum emerging for the forecast period. In Russia, the economy is picking up; in Brazil, however, the situation is unlikely to improve considerably in the near future, with the long-awaited economic recovery nowhere in sight. At 3.7 percent, the overall increase in global output this year is expected to be higher than it was in 2016. It will be somewhat higher the year after that. DIW Berlin has slightly increased the previously forecasted figures for both years (Table).

Consumption should remain the primary growth driver in the developed countries, mainly due to the improving labor market situation. Employment continues to grow in both the U.S. and the euro area, though consumer demand is likely to temporarily lose some momentum. This is mostly due to the higher inflation rates, which in turn result from the higher energy prices. In the U.K., the British pound has depreciated sharply, which additionally increases consumer prices. In the U.S., expansive fiscal policy measures are expected to further drive up inflation. All in all, investment should make a bigger contribution to growth than it has in the past, especially since the higher inflation rates will offer businesses more opportunities to increase prices and margins than in the low-inflation global environment of the past few years. This can be seen, for example, in the increase in corporate profits as well as the optimistic outlook for manufacturing in the U.S. and the euro area. The robust domestic demand in the developed countries should benefit

In Percent

the emerging countries' exports. The rise in commodity prices will also have a positive impact on many emerging economies, as well as on U.S. investment.

The global rise in prices, however, will probably lead to a tightening of monetary policy. In the U.S. in particular, the Federal Reserve's policy will be less expansionary due to the steadily improving economic situation. This should lead to a somewhat more restrictive monetary policy in the emerging countries as well, in order to avoid excessive capital outflows and exchange rate fluctuations. The central banks in Europe and Japan are expected to continue conducting a supporting policy over the course of the forecast period. Fiscal policy around the world will be somewhat more expansive than previously, with stimulus measures expected in the U.S.

There are a number of risks for the global economy, which may particularly affect investment more adversely than this forecast assumes. The unpredictability of the new U.S. government's economic policies, the forthcoming Brexit negotiations, and the upcoming elections in several key euro area countries could increase uncertainty in both the U.S. and Europe. An increase in worldwide protectionism – mainly originating in the U.S. – poses risks for world trade, and this could have particularly negative effects on export-oriented economies as well as on some emerging Asian and Latin American countries.

¹ Due to a correction of the official employment figures by the Federal Employment Agency (Bundesagentur für Arbeit), selected variables of the system of national accounts (SNA) have been adjusted for this forecast. These figures are highlighted in italics and shaded background. For details (in German) please refer to Box 1 in Ferdinand Fichtner et al. (2017): Deutsche Wirtschaft: Beschäftigungsaufbau stark, Investitionstätigkeit schwach. DIW Wochenbericht 11, 188 f.

¹ Due to a correction of the official employment figures by the Federal Employment Agency (Bundesagentur für Arbeit), selected variables of the system of national accounts (SNA) have been adjusted for this forecast. These figures are highlighted in italics and shaded background. For details (in German) please refer to Box 1 in Ferdinand Fichtner et al. (2017): Deutsche Wirtschaft: Beschäftigungsaufbau stark, Investitionstätigkeit schwach. DIW Wochenbericht 11, 188 f.
