DO NOT QUOTE

Investment in Agricultural Research and Extension:

A Survey of International Data

Robert E. Evenson and Yoav Kislev

When authors request that their manuscripts not be quoted they usually have in mind a certain probability that the next version will differ in some aspects from the present one. The next version of this survey will be a substantially modified version, with probability one. Being a survey of data in a statistically neglected field, this paper draws heavily on a wide assortment of sources and on more than a regularly justified share of estimates, judgments and data adaptations (not to mention errors). Since the main purpose of this version of the survey is to invite criticism, corrections and hopefully also the discovery of new data sources, we decided to make its coverage as wide as possible. In the next draft we not only hope to correct and improve the data, but it will also be necessary to eliminate a few countries or items for which the reliability of the available information is clearly lower than for the rest of the material.

It is widely acknowledged that the development and use of new techniques of production has been a dominant feature of the agricultural economics of most developed countries. There is also wide agreement among economists concerned with economic development problems, that changes in the techniques of production and productivity gains in the agricultural sector are of critical importance to the process of development. In spite of this agreement on the importance of the introduction of new techniques of production very little attention has been given to study of the economic activities that develop new techniques and facilitate their adoption by farmers.

This paper is a report of the first phase of a study of agricultural research and extension activities. The primary focus of the larger study will be the testing of hypotheses regarding the "productivity" or production-increasing effects of organized (and usually publicly supported) research and extension. It is a measure of the limited emphasis on research and extension as economic activities, that a comprehensive compilation of data on research and extension activities for all countries of the world does not presently exist.¹ This paper develops a compilation which, while not as complete as would be desirable, does enable an overview of this important activity. While we present a number of calculations for comparative purposes, this paper is not intended to be an analysis of the productivity of research and extension nor is it an analysis of the determinants of the demand for public investment in these activities.

Expenditure and Man-Year Data

Ideally time series data for each country in the world on expenditures and manpower for carefully defined research activities and extension activities is desirable. A number of regional surveys of research and development activities have been undertaken by such organizations as OECD, UNESCO and FAO, and we have relied heavily on them in this paper. These prior efforts have contributed considerably to the development of consistent definitions of research activities for purposes of collecting data with international comparability, but many problems remain. In our review of the available

¹Several regional compilations for different parts of the world do exist and will be mentioned below.

data, for example, we find that the definition of a researcher ranges from " a person engaged in independent research with graduate training at the Ph.D. level" to people with less than college or university training.

Some of these problems can only be solved arbitrarily. The distinction between the researcher and the technician and between quality research and repetitive and unimaginative field trial work is not easily measured. We had to accept the country's definitions. The Latin American countries and Spain for example, grant the Ingeniero Agronomo degree as the basic degree in the agricultural sciences. This degree appears to be a strong professional degree in most Latin American countries, but with a relatively small research training component. Since it is the degree which most researchers hold in these countries, any definition of research qualifications which excluded it would preclude the collection of data.

Basically, we have tried to make determinations consistent with the OECD research survey definitions. Even this has not been possible in all countries and as a result, the data for scientific man years (SMY) reflect considerable quality differences.²

The data on research expenditures pose probably smaller consistency problems, though the definition of what constitutes genuine research may differ from country to country. In general, agricultural research is what experiment stations do, even though it may vary greatly in quality. We have expressed all expenditure data in this survey in 1965 constant U.S. dollars.

²As part of this study a number of surveys were sent to Ministries of Agriculture and other agencies throughout the world. The survey asked that researchers be defined as having graduate training at the Ph.D. level. The replies reflected the difficulty with the definitions and where we have included survey data we have tried to make it consistent with data from other sources.

No doubt errors due to exchange rates and price deflators have been introduced.

A major problem with the research data is the coverage of the administrative units. Most countries support and organize agricultural research under the Ministry of Agriculture. However, in many cases other Ministries or organizations also conduct agricultural research. We have not been able to collect data on research by private firms in the machinery and chemicals industries for example. More serious is the possibility that some of the figures include only Ministry of Agriculture data, when the Colleges and Universities and the Ministry of Science are supporting substantial unreported research.³ For the most part, these problems are not serious for the large spending countries.

The extension data are somewhat less susceptible to errors of definition. We generally have tried to exclude home economic and youth activities from our data. In some countries the field workers may have relatively little training and may function as community development agents. We have not included community development agents (such as the Grom Sevak's in India) where we could exclude them.

The set of Appendix Tables 1.1 to 1.6 include the data on research and extension that we have been able to assemble. All sources are given in the notes to Appendix Tables 1. An attempt has been made to exclude research work on forestry and fisheries from the data. Research work by international institutes is generally not included in the tables.

³ We have found several instances where one group claimed it was doing all of the research in agriculture when this was not the case.

The reader will note that we have not been able to develop complete time series data. The coverage is quite good in the most recent years, however. (We hope to be able to obtain more data with another survey mailing.) In view of the spotty coverage over time, we have decided to concentrate more heavily on the data for the 1962-68 period centering on 1965. In Table 2 of the appendix we present data for 1965 levels of expenditures in research and extension and in research man years and numbers of extension workers for most of the countries of the world. These data are summarized by World regions in Table 1. (They are based on the row data in Appendix Tables 1.) Some adjustments have been made where choices between conflicting numbers are involved and where data for a year different from 1965 was used. A comparison of the two tables (Appendix Tables 1 and 2) will allow the reader to determine the adjustments made.

In discussing Table 1 we must note several factors. First the data on expenditures and man years in the first four columns are adjusted for the missing data in Appendix Table 2. They represent our best estimates of the 1965 data for the entire region.⁴ Thus, the regional data can be summed to get world total research expenditures of 941 million dollars and extension

⁴The procedure for estimation was to fill in the missing data by applying the region's ratio of expenditures to SMY to existing data on SMY's or Expenditures. Many gaps were thus filled. Where this could not be done, the ratio of research expenditure to extension expenditure was used to estimate the missing element. Finally, expenditures per farm were used. In some cases data from other regions were used to get extension data. In Africa, only East Africa had extension data of wide coverage. Its ratio of extension per farm and per research dollar was used to fill in North and West Africa figures. Wherever more than 10 percent of a figure in Table 1 was based on estimates it is placed in parentheses. All of the ratios in the Table are based on actual data for only those countries in the region which had data for both components of the ratio.

Oceania	137.75	5.66

For definitions and sources see notes to Appendix Tables 2. and 3.

expenditures of 607 million dollars. (These expenditure levels have risen considerably since 1965, perhaps by a factor of 50 percent or more in some cases). This estimate does not include private research activity relevant to agriculture which ranges from practically nothing in the low income countries to a level approximately the same as the public research activity for the U.S.A.

It also does not include a substantial amount of agriculturally related research conducted in institutions not considered part of the agricultural research establishment. Research in plant physiology, for example is conducted in general biology departments to a large extent. Nonetheless, the estimate of the level of research expenditure must be considered very low in light of comparable research spending in other fields.

The regional distribution of spending for both research and extension is apparent. Central and South America, the Middle East, South Asia, and North, East and West Africa account for only 13 percent of the total research expenditures. These regions which are dominated by low (and medium) per capita income countries are not spending proportionately as much on research as the other regions (as will be noted below they have increased their activities at a rapid rate in recent years, however). The Table includes a number of additional calculations of interest. All ratios in Table 1 (and Appendix Table 2) are based on actual data from Appendix Table 2 (indirectly from Appendix Tables 1). They are based on data from those countries in the region for which data for both components of the ratio was available.

The relative spending on agricultural research and extension by region is reflected in the figures on the percent of the value of all agricultural

output spent on research and extension (in 1965). South Africa and Oceania spend in excess of 1.5 percent. East Asia (mostly Japan), North America and Northern Europe spend from .8 to 1 percent. In contrast South Asia and South America spend less than 1/4 percent.

Research expenditures per man year vary considerably and probably reflect some of the definitional problems mentioned earlier. It is somewhat surprising that this figure is almost as high in Northern Europe as it is in North America. The very low figure for Eastern Europe is based heavily on data from Yugoslavia and is subject to problems of definition. The data for South Asia and Latin America indicate that it may be possible to purchase a scientific man year for one third the U.S. price, (providing the SMY data are comparable).

Extension expenditures per worker appear to be very much higher in North America than elsewhere. In general the expenditures per extension worker fall relative to expenditures per SMY as the level of per capita income declines. In spite of this the ratio of expenditures on research to extension appears to be much lower in the low per capita income countries. When the data are expressed in per farm terms, the large differences in the size of farm between regions tend to dominate the results.

Agricultural research work has grown in complexity and sophistication over the last several decades. It often requires the incorporation of knowledge and methods from biology, chemistry and physics and collaboration of specialists from different lines of research. This may make the size of the research institution an important factor in determining the productivity of the work done. Table 2 presents size distributions of experiment stations

Table 2

Size Distribution of Experiment Stations: Selected Regions and Countries

in several countries and regions. Note, for instance, the large American stations and the very small African stations (except South Africa).

Research Publications in the Agricultural Sciences

The last two columns in Table 1 (and in Appendix Table 2) are the ratios of research expenditures and SMY per publication in the agricultural sciences. We introduce data on publications in this paper because in some ways they overcome many of the difficulties with the expenditure and man-year data. Table 2 (and Appendix Table 3) present detailed data on publications by commodity orientation for three different time periods.

The use of scientific publications counts can be defended on at least three grounds: 1) they are more comparable internationally, 2) they enable a complete time series, and 3) it is possible to allocate research effort to commodities. The publications reported in these tables are the result of complete country by country counts of approximately 205,000 publications in the agricultural sciences. They are taken from several scientific abstracting journals, and represent papers from more than 1,000 scientific journals. The organizations publishing the abstracts apply international standards to the selection of papers and journals and classify the papers according to commodity orientation. There may be some bias in the application of the standard for abstracting, but we do not believe it to be too serious.⁵

⁵In Table 3 and Appendix Table 3, the crop oriented publication data are from Plant Breeding Abstracts, a journal that has provided abstracts of the world literature since the 1930's. Dairy research is from Dairy Science Abstracts and the remainder from Biological Abstracts. They are all classified to countries by the address of their first author.

The application of a single standard by the abstracting journal not only bypasses the exchange rate problem but enables a quality of research measure as well. If the distribution of quality of papers is not seriously biased by country or region, the total number of papers per period should be a good measure of meaningful research activity.

Table 3 presents data for three 7 year periods, 1948-54, 1955-61, and 1962-68. All publications are totals for the seven year period. Publications per \$100 million of commodity value are expressed on a mid-period year basis. Publications are the average for the period, commodity values are in 1957-59 U.S. dollars for the mid-period year.⁶

The Tables enable to see what has been happening over time quite clearly. We notice for example that Northern Europe has increased only moderately over time, while Eastern Europe and USSR experienced a five-fold increase over the three periods. The numbers of publications are closely related to the research expenditures as expected and when expressed as publications per unit of commodity value we observe Northern Europe and Oceania with substantially higher values than other regions. Again, Latin America, the Middle East, and Africa do poorly by this measure, while South Asia shows up somewhat better than the earlier measures indicated. The low income regions are expanding publications relatively rapidly over the period.

Publications by commodity show considerable variability, some of which is caused by a lack of commodity value data (which show up as -0.0 in the Table).

⁶Actually 1957-59 average commodity values are used for the middle period. Commodities are summed using 1957-59 price units except for Oceania and South Asia where 1961-65 units are used.

SEE NOTES TO APPENDIX TABLE 3.

When we aggregate papers to include Phytopathology and Soil Science with all crops and Animal, Poultry and Dairy with Livestock, the publications per \$100 million of commodity value vary less than we might have expected. (Plant Physiology publications are not included in the calculations). Papers on Dairy research appear to be constantly high relative to value though some of the figures are inflated by poor data for the value of dairy production in South Asia. Poultry, Wheat, Sorghum, and Rice publications tend to be low relative to value. Variability of the ratio over countries and regions is considerable.

Plant physiology research is included in the Tables to get a measure of the agriculturally-related "basic" research undertaken. Only 10 to 20 percent of this research is conducted in the agricultural research "establishments". The bulk of it is done in biological science departments in universities. The Table indicates that very little of this research is done in Latin America and Africa.

Summary

This compilation of data relevant to investment in research and extension reflects many of the difficulties involved in developing an appropriate measure of knowledge production and distribution activities. Some improvements can be made with more data, especially for extension work. Many of the problems with the research data will not be easily resolved. It seems that FAO is now preparing the machinery of collecting international data; if this is done it will represent an improvement over the present data.

Table 4

Regional Shares: Research and Extension - 1965

Region's Share in World Total:

Region	Agr. Res. Expenditure (1)	Agr. SMY (2)	Agr. Sci. Publications	Plant Phys. Pub.	General Science Research	Agr. Extension	
						Expend. (3)	Workers (4)
Northern Europe	.202	.142	.222	.258	.270	.175	.084
Southern Europe	.024	.038	.035	.028	.024	.041	.026

South Africa	.026	.019	.009	.004	.003	.018	.031
Oceania	.066	.044	.043	.041	.020	.053	.007

Note: General Science Research--received from Professor Price, Department of the History of Science and Medicine, Yale University.

For purposes of analysis it will be important to have historical data and we believe that this compilation will be of some value in that context. Our examination of the data on publications leads us to conclude that over-all it is the most internationally comparable and complete of the measures available.

Table 4 presents regional share data for several measures and will serve to summarize some of the substantive features of the data. North America and Europe expenditure shares dominate. The shares of both plant physiology and general science research are lower than the comparable measures for the agricultural sciences for most low-income regions.

These data no doubt reflect many factors. To some extent they are associated with the productivity of research. We believe that they tell very much about the productivity issue, however, that is subject to analysis in a different framework. Certain demand factors are also reflected in the data. The relationship of almost all of the measures with the level of development is quite apparent. The processes by which decisions regarding public expenditures for these activities are made, are quite varied and complicated and we do not believe that the relationships presented in this paper reveal more than the most general effects of economic factors on them.

Appendix Tables

General Notes

1) -0.0 = no information available (blanks in Tables 1.1-1.6)
0 = item at zero level

2) Regional classification

Northern Europe: Austria, Belgium, Denmark, Finland, France, Germany (Fed. Rep.), Ireland, Netherlands, Norway, Sweden, Switzerland, United Kingdom.

Southern Europe: Greece, Italy, Portugal, Spain.

Eastern Europe
& U.S.S.R.: Bulgaria, Czechoslovakia, Germany (East), Hungary, Poland, Romania, Yugoslavia, U.S.S.R.

North America: Canada, U.S.A.

Central America
& Caribbean: Cuba, Dominican Republic, El Salvador, Guatemala, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama.

South America: Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, Venezuela, Guyana.

Middle East: Libya, Sudan, United Arab Republic, Cyprus, Iran, Iraq, Israel, Jordan, Lebanon, Syria, Turkey.

South Asia: Burma, Cambodia, Ceylon, India, Indonesia, Malaysia, Pakistan, Philippines, Thailand, Republic of Vietnam.

East Asia: Taiwan, Japan, Republic of Korea.

North Africa: Algeria, Morocco, Tunisia.

East Africa: Ethiopia, Kenya, Madagascar, United Republic of Tanzania, Uganda.

West Africa: Cameroon, Angola, Democratic Republic of Congo, Dahomey, Ghana, Guinea, Ivory Coast, Liberia, Mali, Nigeria, Senegal, Sierra Leone, Togo, Upper Volta.

Southern Africa: South Africa
Southern Rhodesia

Oceania: Australia, New Zealand.

Notes to Appendix Table 2

- \$RES, \$R - Expenditures on research (in thousand 1965 **US** dollars)
- S.M.Y. - Scientific man-year.
- \$EXT, \$E - Expenditures on extension (in thousand 1965 U.S. dollars)
- E. WKRS, EW - Number of extension workers.
- \$ Ag - Value of agricultural production (in thousand 1965 U.S. dollars)
- F - Number of farms (in thousands).
- PUB - Number of publications.

Notes to Appendix Table 3

WHT - Wheat
BAR - Barley
MAZ - Maize
SOR - Sorghum
SUGR - Sugar Beet or sugar cane
POTA - Potatoes
COT - Cotton
ANIM - Animal Production
POUL - Poultry
DAIR - Dairy
PYTO - Phytopathology
SOIL - Soil Sciences
PHYS - Plant Physiology

CROP - Sum of the crops, Phytopathology and Soil Sciences

LIVE - Sum of Animal Production, Poultry and Dairy.

The ratio in the DAIR column is to value of milk production.

Plant Physiology is not included in the totals.

* No counts for this period in Plant Physiology.

All crop data (Plant Breeding Abstracts) are annual counts for the whole period. Other research publications were counted in selected years. All numbers in the table are adjusted to seven year base (totals may not sum exactly).

Commodity values are from Indices of Agricultural Production, U.S.D.A., ERS, (several issues).
