German economy still running at high capacity

By Ferdinand Fichtner, Karl Brenke, Marius Clemens, Simon Junker, Claus Michelsen, and Thore Schlaak

The German economy is on track for continued growth. Due to the unexpectedly robust first six months of 2017, the German Institute for Economic Research is raising its forecast for GDP growth to 1.9 percent for the current year. This year and arguably for the coming two years, the country's output will exceed potential output; nonetheless, there is no risk of overheating. Economic growth will slow down somewhat, not only because demand from abroad will be expanding at a slower rate. Additionally, both private consumer and public spending will experience only moderate increases, while companies will continue their reluctance to invest in new machines and facilities. Inflation should rise only slightly, even given modest wage increases, which further reflects the continued growth of the potential labor pool. The economy is also beset with numerous risks. For example, exports could be adversely affected if the external value of the euro were to rise—for instance as a result of a more restrictive monetary policy than assumed here. And it is entirely possible that increasing protectionism could hinder world trade.

The German economy will continue to flourish, although growth will slow down somewhat in comparison to recent quarters. The country's productive capacity will continue to be utilized well but not excessively, and, taking into account that wages and prices will grow moderately, overheating will not be an issue during the forecast horizon. The inflation rate should rise slightly during the forecast horizon and will not endanger price stability.

In the past two years, private consumer and public spending have played a major role in Germany's economic development due to the influx of refugees and the decline in oil prices (see Figure), but these effects are losing their importance. Deceleration in consumption momentum will primarily affect the service sector but consumer goods will also falter. As a result, the overall economy will lose a bit of momentum.

Export-oriented industrial companies will still benefit from dynamic demand from abroad for a while. However, the perceptible appreciation of the euro against the dollar should have a dampening effect in upcoming quarters and starting at the middle of next year. Key markets, in particular the euro area, where the economy recently improved, will lose some momentum. Demand from emerging countries has also been strong recently but will probably weaken in the wake of the gradual structural slowdown in China.¹

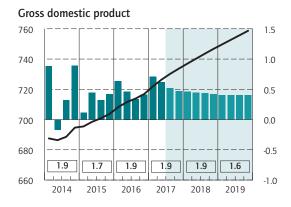

This will not only reduce the growth rate of the domestic economy. Exports will also experience a slowdown in expansion (see Table I). Companies will continue to hire more labor but not at the same rate of expansion as previously. As a result, total earned income will grow more slowly, although somewhat sharper wage increases are anticipated for the later part of the forecast horizon. Due to the demographic shift, the expansion rate of the labor

force will slow down because fewer and fewer people will migrate to Germany from other EU member states as a result of the recovery there.

All things considered the German economy should grow by 1.9 percent this year (see Table 2). In comparison to June, DIW Berlin is raising its forecast by 0.4 percentage points.² This year there will be three workdays fewer than in 2016. Without taking this effect into account, the economy would grow by 2.2 percent. In 2018, Germany's GDP should grow by 1.9 percent and the following year by 1.6 percent. The forecast for GDP growth is subject to uncertainty. Based on earlier forecast errors, we can state there is a 68 percent probability that growth in 2017 will be between 1.7 and 2.1 percent and in 2018 between 1.5 and 2.3 percent.³

Even though the current account balance will decline to just below eight percent at the end of the forecast horizon, it continues to be excessively high levels.

Actual output is somewhat higher than potential output. This (positive) gap in output will slightly widen this year and next but remain at the same magnitude in 2019. Part of the reason the gap will not close is that as of 2019, the

demographic shift will trigger a sharp drop in economic growth. On the other hand, it will not expand appreciably—primarily due to the fact that company investment in new machinery and facilities will continue to be moderate. During earlier upswings, the increase in company investment was much stronger than anticipated now, providing fuel for productive capacity overload.

The reasons for weak investment are many. The general conditions for entrepreneurial activity in Germany, for example, appear to have worsened in recent years. The companies surveyed by the Association of German Chambers of Commerce and Industry (DIHK) give key business factors significantly lower ratings than they did three years ago, in particular: broadband transmission, commercial space availability, and transport infrastructure.4 With an eye to the demographic shift and its deceleration of potential growth, companies currently tend to plan their expansion of domestic capital stock conservatively. The anticipated slowdown in the world economy in part due to burgeoning protectionism—is an added factor. Ongoing political uncertainty in many nations around the world is likely to affirm German companies' instinctive conservatism when it comes to investment spending. And in the later part of the forecast horizon, a more restrictive monetary policy will likely put a damper on investment as well.

Widespread geopolitical instability engenders risks for the forecast. It could prove more damaging to investment in general—not only in Germany—than assumed in the calculations, which would have an additional negative effect on German exports as they are primarily investment goods. And the decisions on economic policy made after the Bundestag election could change conditions generally. Some euro area banks are still carrying risks on their balance sheets. If the relevant loans are defaulted on,

the resulting distortions in the financial markets would spill over into the real economy. The accuracy of the present forecast could also be adversely affected if the European Central Bank takes longer to pull out of the bond purchase program than assumed here. This scenario could have a positive effect on exports due to an ensuing depreciation of the euro, but the higher rise in prices would have a negative effect on private consumption.
