Abstract: This research study aims at developing and validating E-tailing quality index. It consists of the literature reviews of the past researches, which were done by various authors and while finding the dimensions for the e-tailing quality. The scale development methodology results into six factors comprises of Platform accommodation and customer centric functions, Satisfactory Product/Service quality, Knowledge about product and promptness, Delivery and Sales support, Customer service, Vision and Mission. It is a strategic tool to implement e-tailing quality index effectively and efficiently. This research can also be used to find the opportunities and critical areas which require attention.

Keywords: E-tailing, Retailing, Marketing, Quality Index.

Introduction

E-tailing (or electronic retailing) is the marketing of goods and services according to the demands of customers on the internet. E-tailing quality index includes the dimensions which are strongly associated with the quality of E-retailing. It improves the service quality. As E-business is becoming the popular medium for the transactions that takes place while buying and selling the products. Now days it not only restricted to sell of goods but it evolves the services which are offered to the customers with the product which adds a value to the products that leads to the customer satisfaction. As many services are provided by the e-tailing companies but sometimes the service quality is not good enough or it cannot be identified the dimension in which the company needs to be improved. So, there is a need to know at what extent the dimensions of the e-tailing quality exists and index the whole dimensions in which the improvement is needed and act on that. In the today's competitive environment besides the selling of goods, service quality has to be improved so as to retain customers, build brand name; brand awareness and to make the business grow.

Literature review

There has been a considerable amount of work done on E-tailing quality. There have been a number of factors that have been studied and measured by them. Wolfinbarger and Gilly (2003) predicted the e-tailing quality and measured it by dimensionalizing. They analyzed the four factors: customer service, reliability, privacy and Web design and predicted the customer's perceptions for quality and attitude towards website. Yang *et al.* (2003) provided various management related implications and recommend the ways to improve the e-tailing service quality by introducing many dimensions for the e-tailing quality. Long and McMellon, (2004) explored the determinant of the e-tailing service quality with multidimensional measures and also explored the new dimensions which lead to the area of improvement towards the online service quality. Jun *et al.* (2004) found the customer minimum satisfaction level based on their service quality and established that dimensions had impact on the overall service quality but it had no effect on the satisfaction, but there exists a positive relation between the overall service quality and customer satisfaction. Choia *et al.* (2004) studied the consumer behavior at the point of purchase (like willingness to buy, customer perceptions, values) and how it is affected by the web retail service quality. Collier and Bienstock, (2006) showed the big picture of the e service quality which is more than the website interactivity and encompasses on the outcome and recovery quality while measuring the service quality in the e-tailing. Rossiter, (2007) after Collier and Bienstock find the new measures of e-tailing quality service and found that the measure done by Collier and Bienstock for service quality is insufficient and Arshad *et al.* (2007) made a study on the land transportation services with focusing on the Internet retailing service quality and studied the behavior of the internet users and their activities to determine needs and concluded that by introducing the e-ticket service there will be improvement in the transportation service. Sahney, (2008) used the interpretive structural modeling and quality function deployment to find out success factor in online retailing. Finn, (2010) while generalizing dimensions of e-tailing service quality, concluded that data collected from the respondent is inconsistent and suggested that the manager should not make decisions on bases of the data analysis of variation occurred across the customers. Saravanan and Kannan, (2012) measured e-tailing quality in the rural market by studying the expectations and perceptions of the people living the rural areas by analyzing the behavior and preference in internet usage of the people of rural area. Cass and Carlson, (2012) examined the consumer perceptions about the website's services innovations which influence the quality and loyalty, trust and word of mouth and it is concluded that these factors have more positive effect as compared others. Türk *et al.* (2012) measured the service quality in luxury goods e-tailing and found that both design and product information has positive effect on service quality while it is shown in other studies that there is no or minimum effect of both on service quality in the Luxury goods section, and different instruments should be used to evaluate the service quality for the luxury goods and mainstream goods online. The dimensions for the e-tailing qualities and their number of citations which were found by authors are as given in the appendix.

In conclusion of literature review, it has been found that earlier researches were based on SERVQUAL and SERVPERF model, assuming that quality is the difference between expected and perceived services. And a very limited number of research has been carried out till date on e-tailing quality (Wolfinbarger and Gilly, 2003; Yang *et al.*, 2003; Long and Mc Mellon, 2004; Jun *et al.*, 2004), Choia *et al.*, 2004; Collier and Bienstock, 2006; Rossiter, 2007; Arshad *et al.*, 2007; Sahney, 2008; Finn, 2010; Saravanan and Kannan, 2012; Cass and Carlson, 2012, Türk *et al.*, 2012).

Methodology

Figure 1: Methodology

- Step 1- Dimensions: The dimensions that affect the e-tailing quality are extracted from existing literature.
- Step 2- Number of citations: Firstly dimensions are reduced on the bases of number of citations in the literature review based on the responses collected from customers.
- Step 3- Questionnaire: The questionnaire is designed on the basis of above dimensions on 5-point likert-type scale.
- Step 4- Responses: The responses of the questionnaire are collected from the customers on bases of simple random sampling.
- Step 5- Reliability test: This test is carried out to check the random error causing any inconsistency of data. The value of Cronbach-alpha value should be greater than 0.7
- Step 6- Exploratory factor analysis: It is a data reduction technique to determine possible relationships in general form to estimate relationships. Factor reduction was done by using principal component matrix and rotated component matrix as well with eigen value 1.
- Step 7- Confirmatory factor Analysis: This analysis improves and confirms the results obtained from the exploratory factor analysis
- Step 8- Weighted average score: It determines the ranks of the factor which are more effective in improving the quality of e-tailing.
- Step 9- Service quality index: Determining the acceptable range for this index.
- Step 10- Strategic implementation: Analysis and managerial implications of the results.

Results and Discussion

The feedback of the questionnaire was collected. A total of 196 responses were collected. Then data reliability is checked as well as sampling adequacy also. After that exploratory factor analysis is done. Data reliability is determined by Cronbach-alpha value, which is 0.891 in this case (i.e. > 0.7). The result shows that the questionnaire meaningfully measures service quality. By Exploratory factor analysis we can determine 6 factors based on rotated component matrix with variance of 75.481%.

Table 1: Reliability Statistics

Cronbach's Alpha	N of Items
.891	35

Table 2: Rotated Component Matrix

Dimensions	Component					
	1	2	3	4	5	6

Satisfaction (SPSQ1)		.734				
Reliability (DSS1)				.749		
Security (DSS2)				.800		
Navigation (PACCF1)	.683					
Convenience (PACCF2)	.695					
Responsiveness (KPP1)			.765			
Service Delivery (DSS3)				.534		
Price (KPP2)			.807			
Interactivity (CS1)					.668	
Site design (CS2)					.809	
Credibility (DSS4)				.681		
Assurance		.642				
Appearance (PACCF3)	.714					
Structure (PACCF4)	.734					
Customization (PACCF5)	.865					
Product information (KPP3)			.840			
Reputation (KPP4)			.501			
Empathy (SPSQ2)		.579				
Payment modes					.534	
Personalization (PACCF6)	.598					
Word of mouth (DSS5)				.716		
Response time (PACCF7)	.707					
Competence (SPSQ3)		.568				
Usefulness (VM1)						.554
Vision (VM2)						.564
Aesthetic design (SPSQ4)		.894				
User interface (SPSQ5)		.763				
Courtesy (SPSQ6)		.681				

Initially we have 38 dimensions contributing 75.481% variance which are reduced to 26 after EFA. The dimensions are clustered into factors:

Table 3: Factor reduction

Sr. no.	Factors	Dimensions
1.	Platform accommodation and customer centric functions (PACCF)	Customization Structure Appearance Response time Convenience Navigation Personalization
2.	Satisfactory Product/Service quality (SPSQ)	aesthetic design User interface Satisfaction Courtesy Empathy Competence

3.	Knowledge about product and promptness (KPP)	Product information Price Responsiveness Reputation
4.	Delivery and Sales support (DSS)	Security Reliability Word of mouth Credibility Service Delivery
5.	Customer service (CS)	Site design Interactivity
6.	Vision and Mission (VM)	Vision Usefulness

The factors obtained in this process are confirmed by using CFA using residual data, we first determines that multidimensional model leaves PACCF6, SPSQ2, SPSQ3, KPP4.

Then we check it by structural model that how elimination of least significant factor improves the model and factor index was evaluated to improve importance of factors in model.

Table 4: Multidimensional model fit

RMSEA (Root mean square error of approximation)	0.052
CFI (Comparative fit index)	0.83
GFI (Goodness of fit index)	0.85
Chi Square/ Degree of freedom	2.10

This model points out an acceptable model fit obtained with AMOS 21 statistical tools, CFI and GFI values confirm absolute measure and incremental measure fit (Anderson and Gerbing, 1988). For a fit model errors should be around 6% to 7% (Byrne, 2001). The substantial values of indicators onto their factors vary within acceptable range, the models reflects acceptable psychometric properties (Agariya and Singh, 2012)

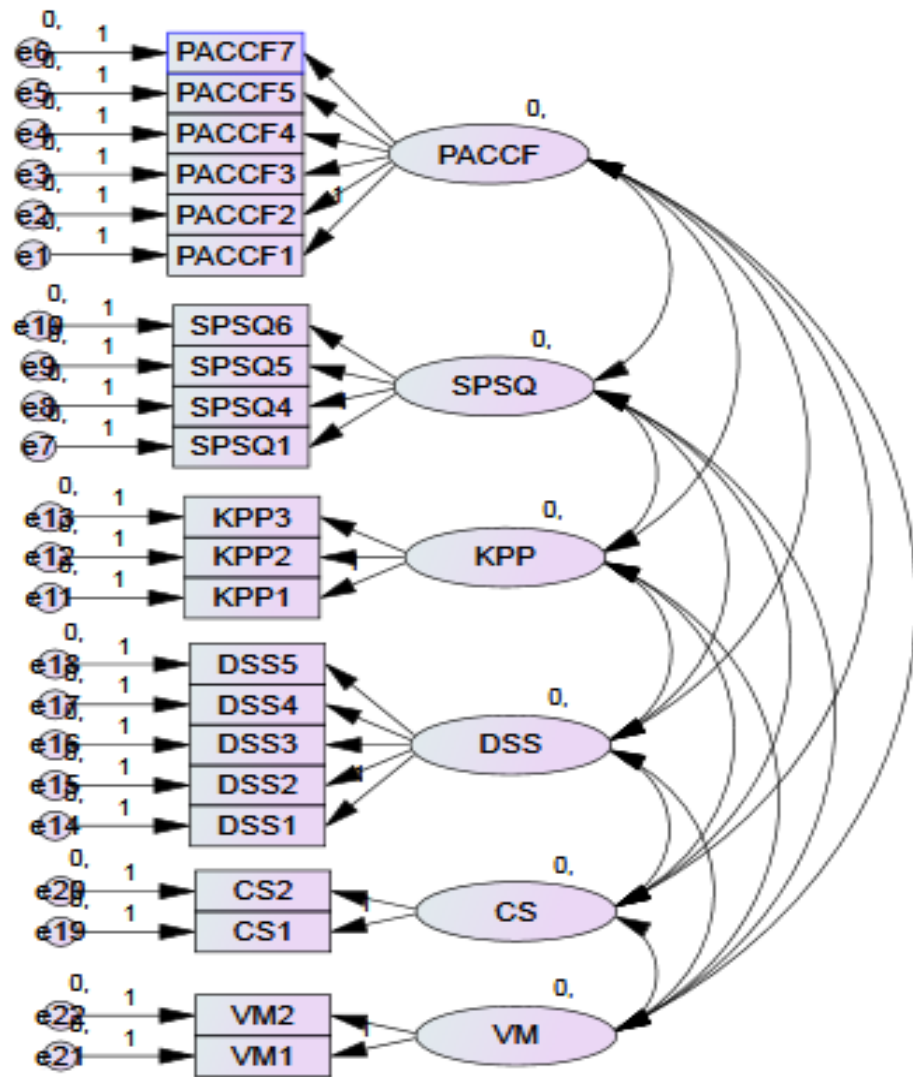

Figure 2: Multi-dimensional model

The structural model is validated by structural equation modeling which consist of a residual error in each factor as indicated in the figure

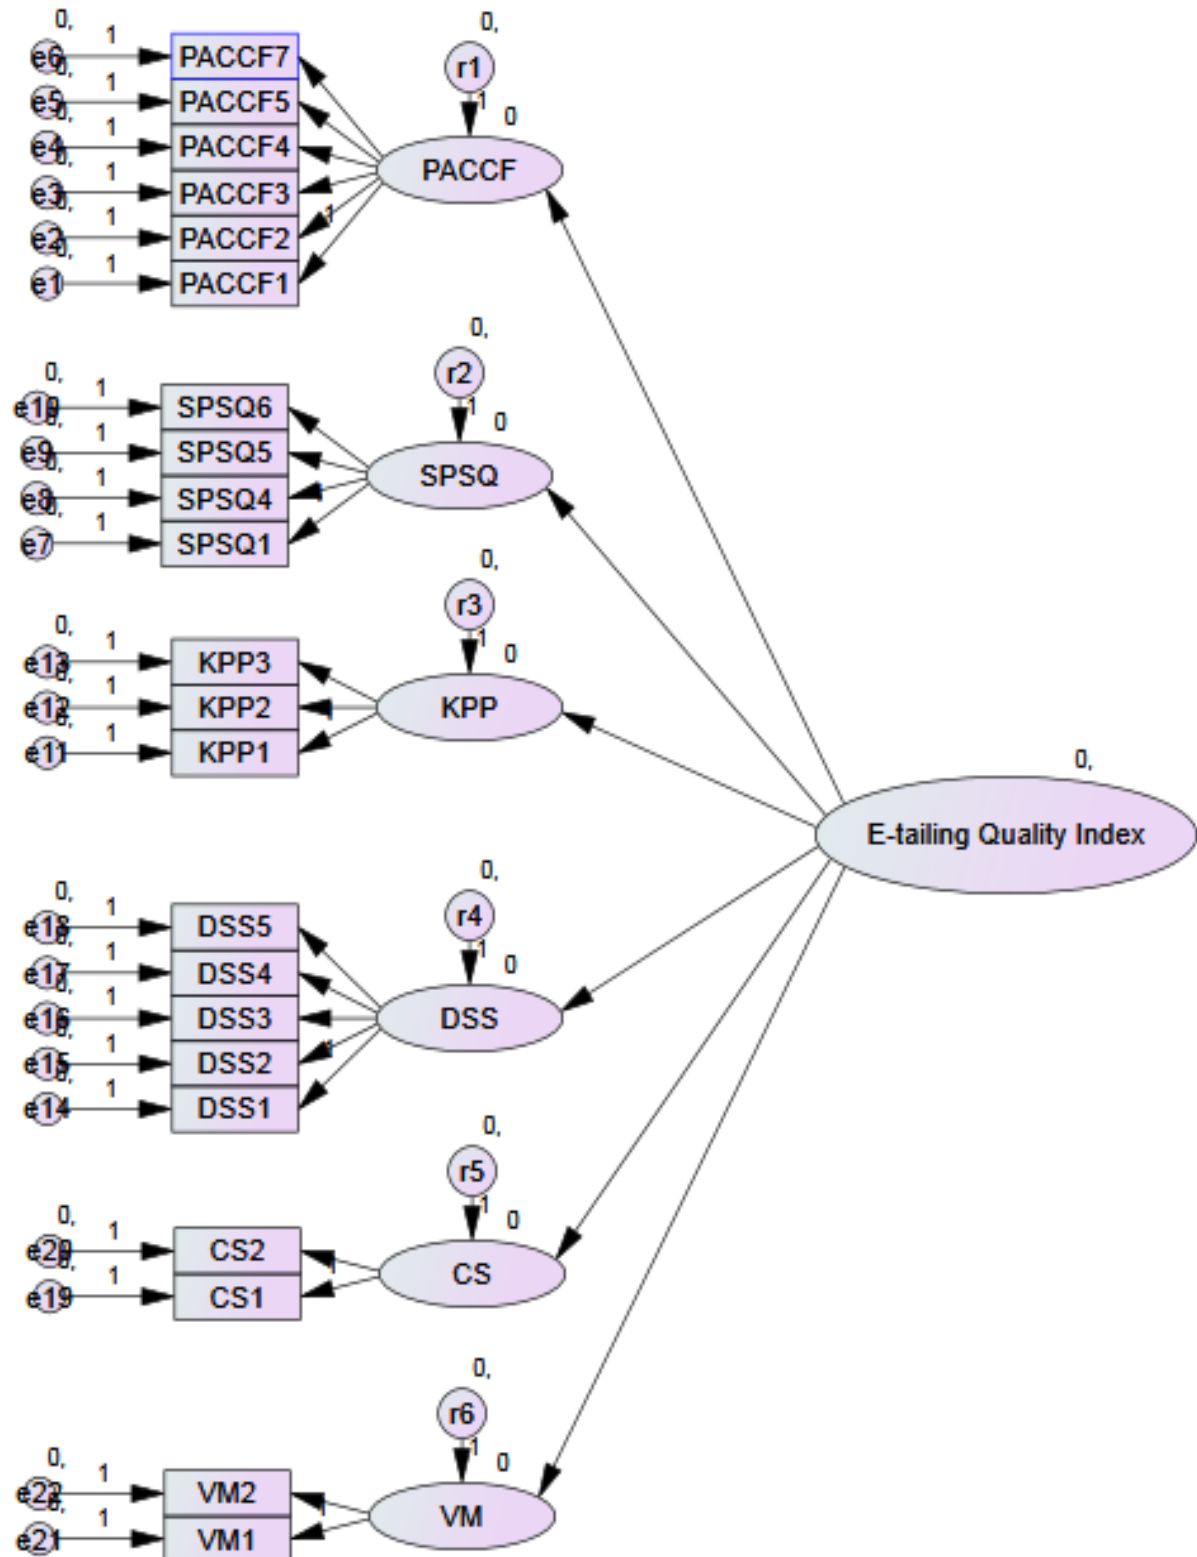

Figure 3: Structural model

The result of this model shows acceptable model fit (Anderson and Gerbing, 1988).

Table 5: Structural model fit indices

RMSEA	0.052
CFI	0.82
GFI	0.803
Chi Square/ Degree of freedom	2.05

The factor index is now evaluated with the help each factor by calculating average with help of SPSS 17

Table 6: Factor Index

Factors	Mean (Ma)	Weight (Wb)	Index (Ma*Wb)
Platform accommodation and customer centric functions	3.47	0.16	0.5552
Satisfactory Product/Service quality	3.78	0.17	0.6426
Knowledge about product and promptness	3.94	0.18	0.7092
Delivery and Sales support	3.56	0.16	0.5696
Customer Service	3.96	0.18	0.7128
Vision and Mission	3.41	0.14	0.4774

Here, in the final result we find the share of these six factors.

$$\text{E-Tailing Quality Index Score} = (Ma_1 * W_1 + Ma_2 * W_2 + \dots + Ma_n * W_n)$$

The score comes out to be 3.664

Strategic implication

From the above result it has been concluded that the in order to improve the service quality in e-tailing we need to improve the Customer service and then next priorities are Knowledge about product and promptness; Satisfactory Product/Service quality; Delivery and Sales support; Platform accommodation and customer centric functions and Vision and mission.

Factor 1: Platform accommodation and customer centric functions:

Dimensions within this factor deals with the processes involving customer convenience:

- **Customization:** An e-tailing website should provide customizable products, by which they are able to get product as their needs get fulfilled without any extra cost and unwanted feature.
- **Structure:** The Structure of an e-tail organization should be flexible enough so as to increase the user-friendliness of the system, and it will be easy for customers to communicate directly.
- **Appearance:** Appearance of an e-tailing website plays a very important role in running the business. Every user first sees the design of a website then look for the products.
- **Response time:** lesser the response time higher will be efficiency as well as revenue. It depends on the problem solving approach. Lesser the time taken to solve the problem more customers will be satisfied.
- **Convenience:** Convenient procedures and services intended to save the resources and increase the accessibility and save the resources as well.

- **Navigation:** E-tailing sites should implement an easy and effective navigation system at both customer and organization ends. At the Organization end there should be process of controlling and monitoring at the customer end.

Factor 2: **Satisfactory Product/Service quality**

Service quality is a very important factor in the e-tailing. In this competitive environment every e-tailing company offers good product so if in any field an e-tailing business can improve that is service quality. As these days, customers are getting service centric as they can get a satisfactory product from any other company producing same product.

- **Aesthetic design:** Good representation of a product on a web site draws attention of a customer and can increase his willingness to buy that particular product.
- **User interface:** if the interface of a web site is user-friendly then it will be more convenient for the customers to browse through and make easy purchases.
- **Satisfaction:** Overall satisfaction of customers, dealers and organization is an essential part of a business growth; it can be in terms of Products or Services.
- **Courtesy:** Courtesy can be showed to customers in various forms (like. Delivery man, Mails, Emails, telephone etc.), through this many customer complaints can be solved.

Factor 3: **Knowledge about product and promptness**

The Dimensions under this factor indicates the product information and timekeeping.

- **Product information:** The customer always wants full information about a product at one place so that customer does not need to go to other sites or stores,
- **Price:** The price is the thing which attracts the customers very strongly; e-tailing products should be having competitive price range.
- **Responsiveness:** The organization should respond each and every individual and solve their problems or doubts. It can bring a strong trust of the customer towards the organization.

Factor 4: **Delivery and Sales support**

Dimensions under this factor deals with the sales and delivery of a product/service.

- **Security:** The customer's trust on an e-tailing organization can be built if the organization guarantees the security of product, money and their personal information as well.
- **Reliability:** The delivery channel should be reliable enough that the product delivered to the customers will be same as ordered and untapped. The organization should be reliable in such a way that the customer needs to sit back and organization should be worried about the product being delivered properly.
- **Word of mouth:** Word of mouth is a very powerful tool for promotion. It passes the information from person to person, and for this no cost has to be paid for promotion.
- **Credibility:** The quality of trust depends on the delivery channel after the product has been dispatched to the customer and also to depends on the past experience of the other customer about both organization and delivery channel.
- **Service Delivery:** Delivering services is a challenging task as this is not a tangible thing but the more challenging task is to show the services that are delivered. Service delivered can be shown to the customers via promotional e-mails, providing special discounts or getting valuable feedback mails *etc.*

Factor 5: **Customer service**

Customer service helps the organization to directly contact the customers; it helps the customers to clear their doubts and troubleshooting the problems. It can be in form of e-mails, frequently asked questions, live chats etc.

- **Site design:** web sites should be designed in such a way that the customer will get their doubts cleared without help of the customer care executive. The perfect example of this is frequently asked questions section and help boxes.
- **Interactivity:** The interaction between the customer and the organization should be effective and efficient enough that queries of the customers will be cleared without any doubt, it can be possible through various mediums (like Telephony, e-mails, live chats etc.)

Factor 6: **Vision and Mission**

- **Vision:** Vision defines the goal of an organization; it keeps motivating the organization to achieve high.
- **Usefulness:** An e-tailing organization should bring usefulness in each and every possible way to bring up some values and come with a mission statement to make the business grow and survive for the long run.

Conclusion

As E-tail market is a cash cow these days, there is much has to be done on innovation to become a star. Even though many researches have been done on this topic but no tool has been developed to provide quantitative insight. This index can be applied in many firms which can be very helpful in strategizing. This research gives insight that which factor is more effective in improving e-tailing quality. It gives both service provider as well as customer perspectives. These results are very useful as previous studies were based on SERQUAL model.

Limitation and future scope

The limitation of this study is the sample sizes which were relatively small, Diversified and large samples can further enhance the validation of this research. There is huge future scope in this study as if it is successful then it can be applied in other industries.
