# Probabilistic Forecasts for the 2018 FIFA World Cup Based on the Bookmaker Consensus Model

Achim Zeileis Universität Innsbruck Christoph Leitner WU Wirtschaftsuniversität Wien

Kurt Hornik WU Wirtschaftsuniversität Wien

## Abstract

Football fans worldwide anticipate the 2018 FIFA World Cup that will take place in Russia from 14 June to 15 July 2018. 32 of the best teams from 5 confederations compete to determine the new World Champion. Using a consensus model based on quoted odds from 26 bookmakers and betting exchanges a probabilistic forecast for the outcome of the World Cup is obtained. The favorite is Brazil with a forecasted winning probability of 16.6%, closely followed by the defending World Champion and 2017 FIFA Confederations Cup winner Germany with a winning probability of 15.8%. Two other teams also have winning probabilities above 10%: Spain and France with 12.5% and 12.1%, respectively.

The results from this bookmaker consensus model are coupled with simulations of the entire tournament to obtain implied abilities for each team. These allow to obtain pairwise probabilities for each possible game along with probabilities for each team to proceed to the various stages of the tournament. This shows that indeed the most likely final is a match of the top favorites Brazil and Germany (with a probability of 5.5%) where Brazil has the chance to compensate the dramatic semifinal in Belo Horizonte, four years ago. However, given that it comes to this final, the chances are almost even (50.6% for Brazil vs. 49.4% for Germany). The most likely semifinals are between the four top teams, i.e., with a probability of 9.4% Brazil and France meet in the first semifinal (with chances slightly in favor of Brazil in such a match, 53.5%) and with 9.2% Germany and Spain play the second semifinal (with chances slightly in favor of Germany with 53.1%).

These probabilistic forecasts have been obtained by suitably averaging the quoted winning odds for all teams across bookmakers. More precisely, the odds are first adjusted for the bookmakers' profit margins ("overrounds"), averaged on the log-odds scale, and then transformed back to winning probabilities. Moreover, an "inverse" approach to simulating the tournament yields estimated team abilities (or strengths) from which probabilities for all possible pairwise matches can be derived. This technique (Leitner, Zeileis, and Hornik 2010a) correctly predicted the winner of 2010 FIFA World Cup (Leitner, Zeileis, and Hornik 2010b) and three out of four semifinalists at the 2014 FIFA World Cup (Zeileis, Leitner, and Hornik 2014). Interactive web graphics for this report are available at: https://eeecon.uibk.ac.at/~zeileis/news/fifa2018/.

Keywords: consensus, agreement, bookmakers odds, tournament, 2018 FIFA World Cup.

# 1. Bookmaker consensus

In order to forecast the winner of the 2018 FIFA World Cup, we obtained long-term winning odds from 26 online bookmakers (also including two betting exchanges, see Tables 3 and 4 at the end). However, before these odds can be transformed to winning probabilities, the

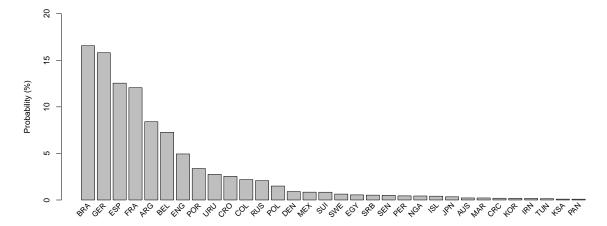

Figure 1: 2018 FIFA World Cup winning probabilities from the bookmaker consensus model.

stake has to be accounted for and the profit margin of the bookmaker (better known as the "overround") has to be removed (for further details see Henery 1999; Forrest, Goddard, and Simmons 2005). Here, it is assumed that the quoted odds are derived from the underlying "true" odds as:  $quoted\ odds = odds \cdot \delta + 1$ , where +1 is the stake (which is to be paid back to the bookmakers' customers in case they win) and  $\delta < 1$  is the proportion of the bets that is actually paid out by the bookmakers. The overround is the remaining proportion  $1 - \delta$  and the main basis of the bookmakers' profits (see also Wikipedia 2018 and the links therein). Assuming that each bookmaker's  $\delta$  is constant across the various teams in the tournament (see Leitner  $et\ al.\ 2010a$ , for all details), we obtain overrounds for all 26 bookmakers with a median value of 15.2%.

To aggregate the overround-adjusted odds across the 26 bookmakers, we transform them to the log-odds (or logit) scale for averaging (as in Leitner *et al.* 2010a). The bookmaker consensus is computed as the mean winning log-odds for each team across bookmakers (see column 4 in Table 1) and then transformed back to the winning probability scale (see column 3 in Table 1). Figure 1 shows the barchart of winning probabilities for all 32 competing teams. According to the bookmaker consensus model, Brazil is most likely to win the tournament (with probability 16.6%) followed by the current FIFA World Champion Germany (with probability 15.8%). The only other teams with double-digit winning probabilities are France (with 12.5%) and Spain (with 12.1%).

Although forecasting the winning probabilities for the 2018 FIFA World Cup is probably of most interest, we continue to employ the bookmakers' odds to infer the contenders' relative abilities (or strengths) and the expected course of the tournament. To do so, an "inverse" tournament simulation based on team-specific abilities is used. The idea is the following:

- 1. If team abilities are available, pairwise winning probabilities can be derived for each possible match (see Section 2).
- 2. Given pairwise winning probabilities, the whole tournament can be easily simulated to see which team proceeds to which stage in the tournament and which team finally wins.
- 3. Such a tournament simulation can then be run sufficiently often (here 1,000,000 times) to obtain relative frequencies for each team winning the tournament.

Table 1: Bookmaker consensus model for the 2018 FIFA World Cup, obtained from 26 online bookmakers. For each team, the consensus winning probability (in %), corresponding log-odds, simulated log-abilities, and group in tournament is provided.

Here, we use the iterative approach of Leitner *et al.* (2010a) to find team abilities so that the resulting simulated winning probabilities (from 1,000,000 runs) closely match the bookmaker consensus probabilities. This allows to strip the effects of the tournament draw (with weaker/easier and stronger/more difficult groups), yielding the log-ability measure (on the log-odds scale) in Table 1.

# 2. Pairwise comparisons

A classical approach to modeling winning probabilities in pairwise comparisons (i.e., matches between teams/players) is that of Bradley and Terry (1952) similar to the Elo rating (Elo 2008), popular in sports. The Bradley-Terry approach models the probability that a Team A beats a Team B by their associated abilities (or strengths):

$$Pr(A \text{ beats } B) = \frac{ability_A}{ability_A + ability_B}.$$

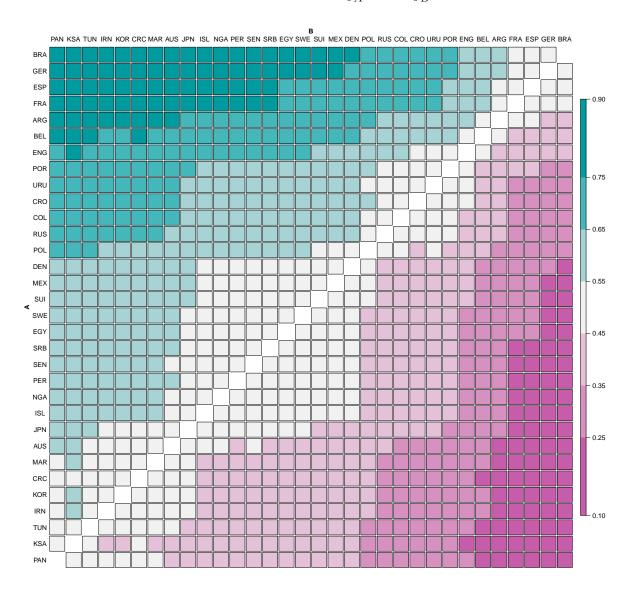

Figure 2: Winning probabilities in pairwise comparisons of all 2018 FIFA World Cup teams. Light gray signals that either team is almost equally likely to win a match between Teams A and B (probability between 45% and 55%). Light, medium, and dark green/pink corresponds to small, moderate, and high probabilities of winning/losing a match between Team A and Team B.

As explained in Section 1, the abilities for the teams in the 2018 FIFA World Cup can be chosen such that when simulating the whole tournament with these pairwise winning probabilities Pr(A beats B), the resulting winning probabilities for the whole tournament are close to the bookmaker consensus winning probabilities. Table 1 reports the log-abilities for all teams and the corresponding pairwise winning probabilities are visualized in Figure 2.

Clearly, the bookmakers perceive Brazil and Germany to be the strongest teams in the tournament that are almost on par, followed by France and Spain which are again virtually on par. The pairwise winning probabilities between these four top teams are close to even with the following winning probabilities for the (slightly) stronger team: Brazil vs. Germany 50.6%, Brazil vs. France 53.5%, Germany vs. France 52.9%, Brazil vs. Spain 53.7%, Germany vs. Spain 53.1%, France vs. Spain 50.2%. Behind this group with the four strongest teams four further teams constitute the "best of the rest": Argentina, Belgium, England, and Portugal. Then, there are several larger clusters of teams that have approximately the same strength (i.e., yielding approximately even chances in a pairwise comparison).

# 3. Performance throughout the tournament

Based on the teams' inferred abilities and the corresponding probabilities for all matches from Section 2 the whole tournament is simulated 1,000,000 times. As expounded above, the abilities have been calibrated such that the simulated winning proportions for each team closely match the bookmakers' consensus winning probabilities. So with respect to the probabilities of winning the tournament, there are no new insights. However, the simulations also yield simulated probabilities for each team to "survive" over the tournament, i.e., proceed from the group-phase to the round of 16, quarter- and semifinals, and the final.

Figure 3 depicts these "survival" curves for all 32 teams within the groups they were drawn in. France, Brazil, and Germany are the clear favorites within their respective groups C, E and F with almost 90% probability to make it to the round of 16 and also relatively small drops in probability to proceed through the subsequent rounds. Groups B, D, and G also have group favorites with good chances to proceed throughout the tournament but these also have a strong second contender: Spain and Portugal in group B, Argentina and Croatia in group D, Belgium and England in group G. In the remaining two groups, A and H, the strongest teams (Uruguay and Russia in group A, Columbia and Poland in group H) have good chances to proceed to the round of 16 but then the probability to proceed further drops sharply. This is due to probably meeting much stronger teams in the round of 16. See also Table 2 for the underlying numeric values.

# 4. Conclusions

Our forecasts for the 2018 FIFA World Cup follow closely our previous studies in Leitner et al. (2008, 2010b) and Zeileis et al. (2012, 2014, 2016) which correctly predicted the winner of the FIFA 2010 and Euro 2012 tournaments. While missing the winner for the other three tournaments, forecasts were still reasonably close: for Euro 2008 the correct final was predicted, three out of four semifinalists for the FIFA 2014 World Cup, and for the Euro 2016 it was correctly predicted that France would beat Germany in the semifinal. However, the latter tournament showed quite clearly that all forecasts are probabilistic and by no means

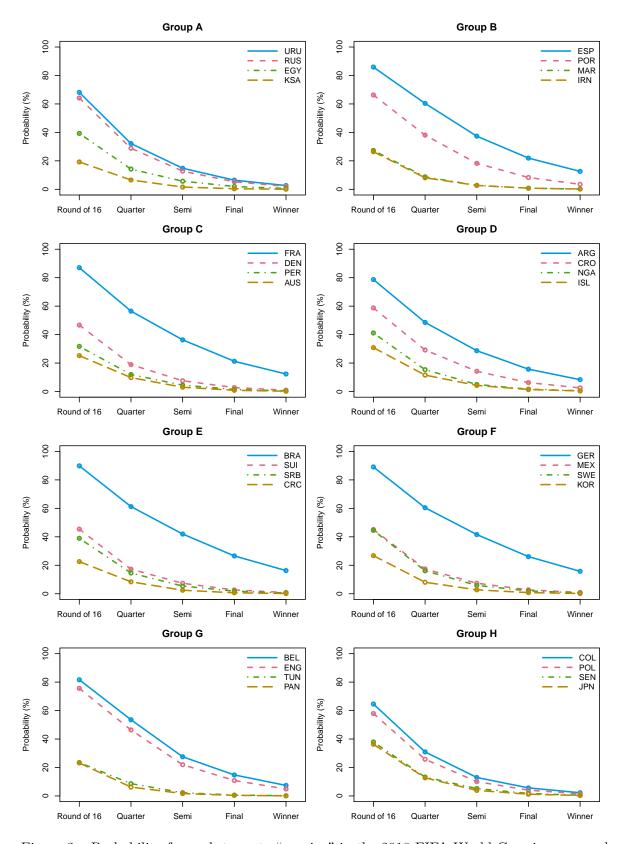

Figure 3: Probability for each team to "survive" in the 2018 FIFA World Cup, i.e., proceed from the group phase to the round of 16, quarter- and semifinals, the final and to win the tournament.

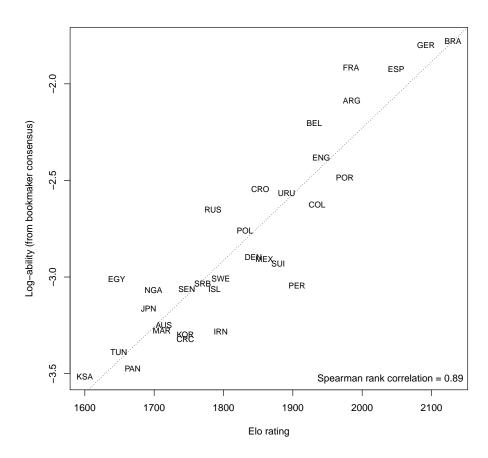

Figure 4: Bookmaker consensus log-ability vs. Elo rating for all 32 teams in the 2018 FIFA World Cup (along with least-squares regression line).

certain: France had a predicted 68.8% probability to beat Portugal, i.e., being expected to win about 2 out of every 3 matches between these two teams. However, in the actual final Gignac failed to seal the deal in added time and Portugal was able to take the victory in overtime.

The core idea of our method (Leitner et al. 2010a) is to use the expert knowledge of international bookmakers. These have to judge all possible outcomes in a sports tournament and assign odds to them. Doing a poor job (i.e., assigning too high or too low odds) will cost them money. Hence, in our forecasts we rely on the expertise of 26 such bookmakers (which actually also include two betting exchanges). Specifically, we (1) adjust the quoted odds by removing the bookmakers' profit margins (with median value of 15.2%), (2) aggregate and average these to a consensus rating, and (3) infer the corresponding tournament-draw-adjusted team abilities using a classical pairwise-comparison model.

Not surprisingly, our forecasts are closely related to other rankings of the teams in the 2018 FIFA World Cup, notably the FIFA and Elo ratings. The Spearman rank correlation of the consensus log-abilities with the FIFA rating is 0.76 and with the Elo rating even 0.89. However, the bookmaker consensus model allows for various additional insights, such as

the "survival" probabilities over the course of the tournament. Interestingly, when looking at the scatter plot of consensus log-abilities vs. the Elo rating in Figure 4 there are a few teams that are either clearly better (above the dotted least-squares regression line, e.g., Russia and Egypt) or worse (below the dotted line, e.g., Peru and Iran) in the forward-looking bookmakers' odds compared to the retrospective Elo rating. In case of Russia, this is surely the home advantage that bookmakers expect to be higher than the Elo rating – and in case of Egypt, this is likely due to the new superstar Mohamed Salah who is still expected to join his team after his injury in the final of the UEFA Champions League.

In addition to general team ratings like Elo and FIFA, various other methods have been introduced for forecasting FIFA World Cups. For example, some banks use their economic rating techniques and apply them also to forecasting major sports events (e.g., Goldman-Sachs Global Investment Research 2014; Danske Bank Research 2014). However, the probabilistic basis for these is often not so clear which can lead to a rather extreme winning probability for the favorite (e.g., up to almost 50% in the aforementioned reports). Better probabilistic results can be obtained by modeling team strengths and simulating tournament outcome "directly" – as opposed to our "inverse" simulation approach. Flexible modeling techniques have been suggested by Groll, Schauberger, and Tutz (2015) and Schauberger and Groll (2018), see the references therein for related approaches. Finally, Ekstrøm (2018) proposed a platform for comparing direct simulated predictions for the 2018 FIFA World Cup.

In summary, it can only be said with certainty that football fans are eagerly awaiting the tournament while its outcome cannot be known before the end of the final in Moscow on July 15. While Brazil and Germany have the best chances to win the World Cup in the bookmakers' expert opinions, it is still far more likely that one of the other teams wins. This is one of the two reasons why we would recommend to refrain from placing bets based on our analyses. The more important second reason, though, is that the bookmakers have a sizeable profit margin of about 15.2% which assures that the best chances of making money based on sports betting lie with them. Hence, this should be kept in mind when placing bets. We, ourselves, will not place bets but focus on enjoying the exciting football tournament that the 2018 FIFA World Cup will be with 100% predicted probability!

Probabilistic forecasts for the 2018 FIFA World Cup based on the bookmaker consensus model

#### Abstract

Football fans worldwide anticipate the 2018 FIFA World Cup that will take place in Russia from 14 June to 15 July 2018. 32 of the best teams from 5 confederations compete to determine the new World Champion. Using a consensus model based on quoted odds from 26 bookmakers and betting exchanges a probabilistic forecast for the outcome of the World Cup is obtained. The favorite is Brazil with a forecasted winning probability of 16.6%, closely followed by the defending World Champion and 2017 FIFA Confederations Cup winner Germany with a winning probability of 15.8%. Two other teams also have winning probabilities above 10%: Spain and France with 12.5% and 12.1%, respectively. The results from this bookmaker consensus model are coupled with simulations of the entire tournament to obtain implied abilities for each team. These allow to obtain pairwise probabilities for each possible game along with probabilities for each team to proceed to the various stages of the tournament. This shows that indeed the most likely final is a match of the top favorites Brazil and Germany (with a probability of 5.5%) where Brazil has the chance to compensate the dramatic semifinal in Belo Horizonte, four years ago. However, given that it comes to this final, the chances are almost even (50.6% for Brazil vs. 49.4% for Germany). The most likely semifinals are between the four top teams, i.e., with a probability of 9.4% Brazil and France meet in the first semifinal (with chances slightly in favor of Brazil in such a match, 53.5%) and with 9.2% Germany and Spain play the second semifinal (with chances slightly in favor of Germany with 53.1%). These probabilistic forecasts have been obtained by suitably averaging the quoted winning odds for all teams across bookmakers. More precisely, the odds are first adjusted for the bookmakers' profit margins ("overrounds"), averaged on the log-odds scale, and then transformed back to winning probabilities. Moreover, an "inverse" approach to simulating the tournament yields estimated team abilities (or strengths) from which probabilities for all possible pairwise matches can be derived. This technique (Leitner, Zeileis, and Hornik 2010a) correctly predicted the winner of 2010 FIFA World Cup (Leitner, Zeileis, and Hornik 2010b) and three out of four semifinalists at the 2014 FIFA World Cup (Zeileis, Leitner, and Hornik 2014).
