## Summary

### English

Policy, administration and industry need medium-term projections of the expected developments in the agri-food markets for their decision-making processes. The EU Commission presents such projections for the EU as a whole in December of each year. Those projections and their assumptions regarding policy and macroeconomic developments are depicted to the level of individual EU Member States with the exception of Luxembourg, which is included in the figures of Belgium, by applying the partial equilibrium model AGMEMOD. The working paper briefly describes the approach to establish projections for the EU Member States. The projections cover the markets of main agricultural products, in particular for cereals and oilseeds (rapeseed and sunflower seed), livestock (cattle, pigs, goats and sheep), meat (beef, pork, and poultry), milk and dairy products (drinking milk, butter, cheese, skimmed milk powder, whole milk and semi-skimmed milk powder). The outcomes comprise items like areas, livestock numbers, yields, production, trade and use, as well as prices. The individual projection results are displayed in tables.

**Key words:** Projections, agricultural market, PE, agricultural market model, dairy market, meat market, grain market, oilseed market, EU member states

## German

Politik, Administration und Wirtschaft benötigen für ihre Entscheidungen mittelfristige Projektionen über die zu erwartenden Entwicklungen auf den Märkten der Agrar- und Ernährungswirtschaft. Die EU-Kommission legt solche Projektionen für die EU als Ganzes im Dezember jedes Jahres vor. Diese Projektionen und ihre Annahmen bezüglich politischer Maßnahmen und makroökonomischer Entwicklungen werden mit Hilfe des partiellen Modellsystems AGMEMOD auf die einzelnen EU-Mitgliedsstaaten mit der Ausnahme von Luxemburg, das mit Belgien regional zusammengefasst wird, herunter gebrochen. Das Working Paper beschreibt kurz den Ansatz, wie die Projektionen für die Mitgliedsstaaten erstellt werden. Die Projektionen umfassen die Märkte für wichtige Agrarprodukte, und zwar insbesondere für Getreide und Ölsaaten (Raps- und Sonnenblumensaat), für Vieh (Rinder, Schweine, Ziegen und Schafe), Fleisch (Rind-, Schweine- und Geflügelfleisch), Milch und Milchprodukte (Trinkmilch, Butter, Käse, Magermilchpulver, Vollmilch und teilentrahmtes Milchpulver) und decken Anbauflächen, Tierbestände, Produktion, Handel und Verwendung sowie Preise ab. Die einzelnen Projektionsergebnisse werden in tabellarischer Form aufbereitet dargestellt.

## 1 Introduction

Since 2001, AGMEMOD<sup>1</sup> (Agriculture Member State Modelling) has been developed and sustained with the aim to provide projections and policy impact assessments for EU Member States and other countries. AGMEMOD partners form a consortium around the main developers of the AGMEMOD model which is a flexible tool with respect to the specific task considered. Moreover, the academic network has been extended to include market experts and stakeholders interested in the results of the AGMEMOD Outlook. The results of these projects have provided the basis for publications in scientific journals and conference proceedings (see Salamon et al., 2008; Erjavec et al., 2011; Salputra et al., 2011; Banse et al., 2012) and numerous reports (see AGMEMOD Partnership, 2007; AGMEMOD Consortium, 2009; Salamon et al., 2010; van Leeuwen et al., 2012; Salputra et al., 2013). Detailed information can be found in 'The future of agricultural markets' by AGMEMOD (Chantreuil et al., 2012) and in Salamon et al. (2017).

The AGMEMOD model is an integral part of the Integrated Modelling Platform for Agro-economic Commodity and Policy Analysis (iMAP) hosted by the JRC (M'barek et al., 2012; M'barek and Delincé, 2015). In an annual process, the AGMEMOD model is applied, from a calibration perspective, to combine the information provided by AGLINK for EU aggregates together with market intelligence gathered by the modelling teams in direct exchanges with national market experts and at specific validation workshops (conducted in Brussels and Herceghalom, Hungary in 2018), both organised by the European Commission together with the AGMEMOD consortium and Hungarian partners of the AKII Institute in Budapest. In this way, medium-term projections for the EU Member States are established which are in line with the EU Outlook (EC, 2017). The publication presented here is based on the 2017 AGMEMOD Outlook.<sup>2</sup> In addition to this AGMEMOD Outlook, there may also exist specific country outlooks based on different, country specific assumptions, fully or partly conducted by applying AGMEMOD (Offermann et al., 2018).

Outlook results become available for each year of the projection for the years 2017 to 2030; however, as the size and number of tables are tremendous, not all years are reflected in those tables within the report but are available online. In the report, five year intervals are presented instead.

---

<sup>1</sup> AGMEMOD has been funded under the European Commission 5<sup>th</sup>, 6<sup>th</sup>, and the 7<sup>th</sup> Framework Programmes as well as under the Horizon 2020 Programme, by contributions from partner institutes, and continuously supported by the European Commission's Joint Research Centre (JRC).

<sup>2</sup> The work was undertaken by partners of the AGMEMOD consortium, with financial support from and in close cooperation with the JRC and the Directorate-General for Agriculture and Rural Development.

## 2 Approach

### 2.1 Process to Create AGMEMOD Agri-food Projections for EU Member States

Starting point for the annual AGMEMOD Outlook process is the European Commission's EU Agricultural Outlook (see for example Nii-Naate, 2011) which provides aggregate projections for the 28 Member States of the EU (EU-28), the 15 countries that were Member States prior to the accession of 10 candidate countries in 2004 (EU-15), and the 13 Member States that acceded to the EU between 2004 and 2013 (EU-N13). First, AGMEMOD is updated with the assumptions of the EU Agricultural Outlook regarding the development of macroeconomic conditions (gross domestic product (GDP), growth, inflation, exchange rates, population growth) complemented with Member State-specific macroeconomic data obtained from national sources. The AGMEMOD Member State modules are, additionally, updated with the most recent information on EU policy measures regarding the CAP and its specific implementations. As far as possible, national policies with a potential impact on the national agricultural sector beyond the CAP are also taken into account. An example of such an additional national policy is an environmental policy that constrains dairy, pig and poultry production in many EU Member States and which is explicitly implemented in the models of the Netherlands (including the recent phosphate reduction measures), Germany and Denmark. In addition to the EU Agricultural Outlook medium-term projections, the latest EU agricultural short-term outlook (for the publication at hand it is EC, 2017b) is considered in AGMEMOD baseline runs.

The outlook process itself comprises several steps: After the implementation of new assumptions and of new endogenous data, a first draft of the baseline is established. Outcomes are checked, validated, equations re-estimated and revised until a coherent draft of the AGMEMOD Outlook baseline projections for EU Member States becomes available. This draft baseline result is then discussed internally amongst members of the AGMEMOD consortium and also with external national agricultural market experts. The feedback obtained in these discussions is used to revise and adjust the Member State models further. Next in the validation, AGMEMOD Outlook workshops are organised by the AGMEMOD consortium, the JRC and DG AGRI, which is held in Brussels by the end of February and a regional workshop in one of the Member States, in 2018 held in May in Herceghalom, Hungary. The workshops gathered about 50 policymakers, modelling and market experts from across the EU to discuss preliminary results at EU Member State level. In a further step, comments made during the workshop are then incorporated as far as possible by final adjustments to achieve the AGMEMOD model presented here.

## 2.2 The AGMEMOD Model

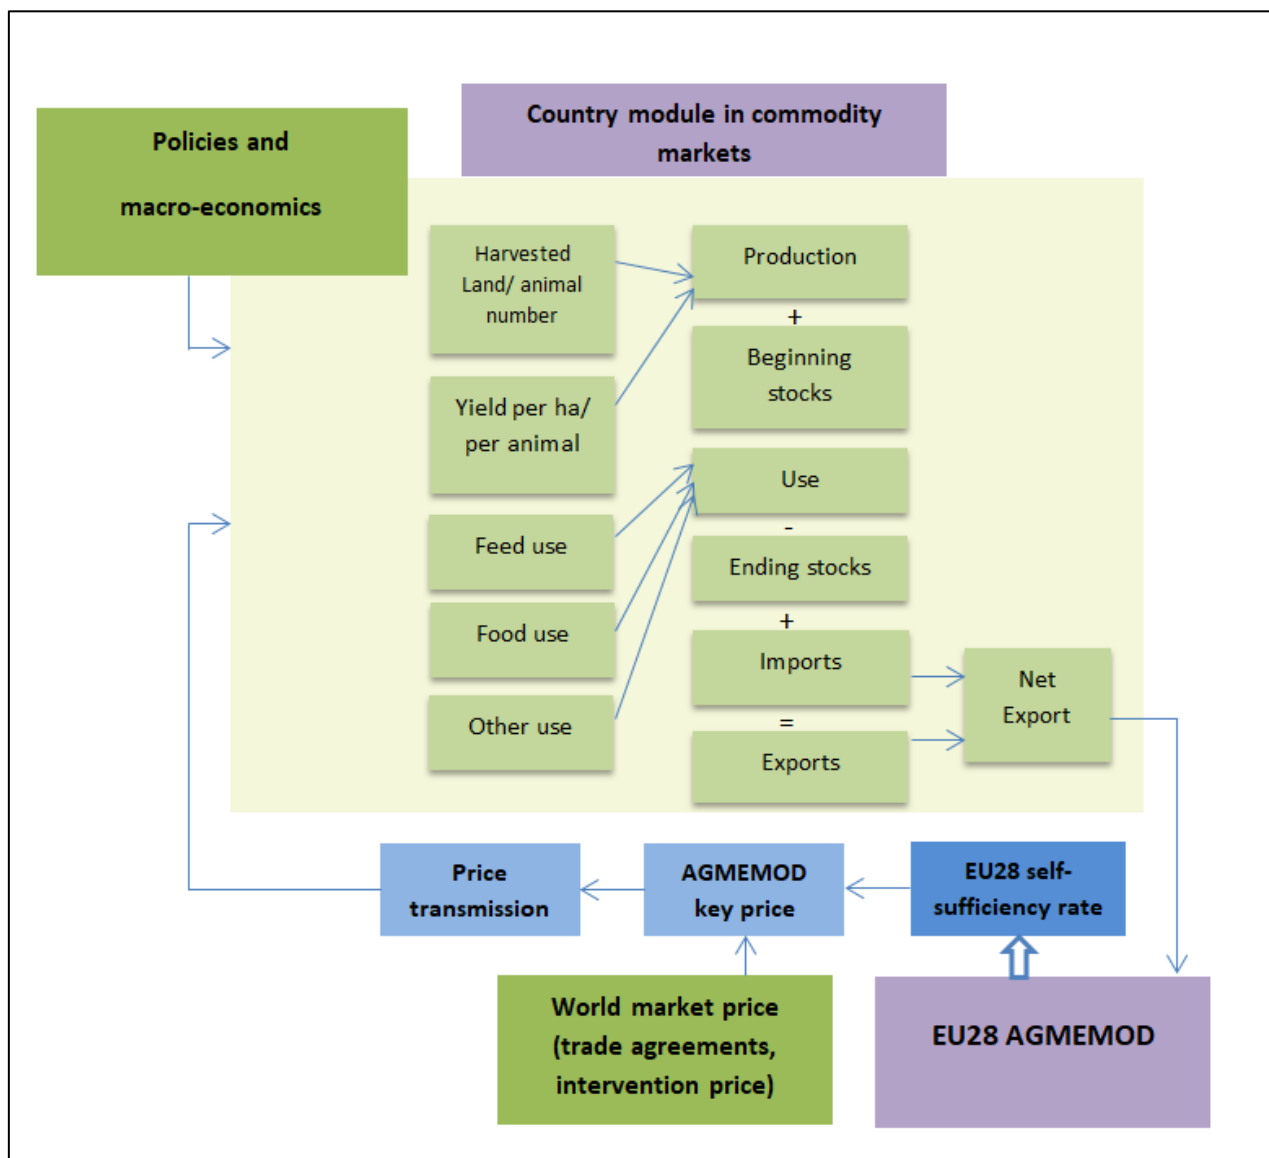

Developing and maintaining AGMEMOD is based on the idea to have a partial equilibrium modelling system with the capacity to establish medium-term projection of the agri-food markets and to undertake model-based economic analysis of the impact of policy or other changes on the agri-food sector in each EU Member States. The AGMEMOD Partnership's approach is a bottom-up one based on country-level models, using a common country model template, and their subsequent combination in a composite EU model (Chantreuil et al., 2012). Ideally, country models are updated, maintained and used by economic modellers in the relevant countries. At its core, AGMEMOD is an econometric, dynamic, partial-equilibrium, multi-country, multi-market model. Based on a set of commodity-specific model templates, country-specific models are developed to reflect the details of agriculture at Member State level and at the same time to allow their combination in an EU model. A stylised version neglecting any detailed representation and policies represents the rest of the world (ROW). A close adherence to templates assures analytical consistency and facilitates comparisons of the impact of a policy change across different countries (Salamon et al., 2008). Generally, the system has been econometrically estimated at individual Member State level (Chantreuil et al., 2012); however, in certain cases, parameters have been calibrated where estimation was not possible. The country models contain behavioural responses of economic agents to changes in prices and in policy instruments and to other exogenous variables in the agricultural market. Commodity prices adjust so as to clear all commodity markets considered on the world market. Quantitative baseline projections are generated for a medium-term horizon on an annual basis.

Country models comprise equations for those commodities representing major agricultural output. In general, six types of cereals, three types of oilseeds and their processed products — oil and meal — sugar beet and sugar, protein crops and potatoes are depicted. For animal sectors, live animals (cattle, pigs, sheep and goats) and meats (beef, pig meat, poultry, sheep and goat meat) are covered separately, while the dairy sector covers raw milk as well as processed products (drinking milk, cream, fresh dairy products, butter, skimmed milk powder (SMP), whole milk powder (WMP) and cheese, plus other dairy products). For each of the crops mentioned, figures are projected on area and yield and implicitly on production, use, trade, stocks and domestic prices (see Figure 1). In the case of oils and meals, figures for crushing of oilseeds and processing into oils and meals, as well as relevant trade, stocks and prices, are also generated.

Animal products cover projections on stocks of live animals, slaughter and trade in live animals. The aim of all livestock models is to determine the ending numbers of breeding animals and the number of animals produced by breeding under consideration of productivity. Within each livestock group, there is a category of animals to be slaughtered. Those animals and their simulated average slaughter weight allow meat production per category to be determined while domestic use, per capita use, trade in meat and domestic prices are other main items projected for animal markets. The dairy sub-model comprises two levels: on the first level, milk production, milk imports, exports, on-farm use and deliverables to dairies are determined, with the last of

these closing the balance. At a second level, the AGMEMOD model allocates fat and protein to different dairy products based on assumptions or estimates concerning the fat and protein content of raw milk and other dairy commodities. Allocation of fat and protein depend on the prices of dairy commodities and other exogenous and endogenous variables. More details can be found in Chantreuil et al. (2012) and Salamon et al. (2017).

**Figure 1. Stylised market representation in AGMEMOD**

Source: Salamon et al., 2017, p. 11.

To solve the modelling system in prices, the supply and utilisation balances of each product at both, the EU and the Member State level must hold and take into account the international trade and other commitments of the EU, such as tariff rate quotas (TRQs). The AGMEMOD model requires equations that impose the market equilibrium or closure (supply equals demand) for

each internationally traded commodity at global level which is achieved by the integration of a stylised ROW model where international prices are formed by closing global balances. International prices affect strongly EU key-prices in the so called key price countries that normally correspond to the most important market, e.g. France for soft wheat. The key price equation links the domestic market to the world market and captures all exogenous variables affecting price formation and the dynamic structure at the EU combined level. For other Member States, prices are defined by a price linkage equation where it is explained by the key price of that commodity and a vector of exogenous variables, for details see Chantreuil et al. (2012) and Salamon et al. (2017).

### 2.3 Data

AGMEMOD requires extensive datasets for the countries included, so establishing a modelling database is a key task. Time series are required for parameter estimation purposes, not only for the supply side of agricultural commodity markets but also for the various types of uses and processing demands. Each country model embraces a country database based on a common template of annual time series, which — depending on the country — ranges from as early as 1973 to the latest available (2017 for this publication). A major part of the AGMEMOD database consists of production as well as supply and use balances for relevant commodities of the country considered, covering production with its components, stocks, imports, different use types and exports, at the level of primary agricultural goods and, often, also at the level of their first processing (e.g. meats, dairy products, oils or cakes). Together with commodity prices, they are determined inside the model and belong to the set of endogenous variables (Salamon et al., 2008).

National teams responsible for country data bases need to compile data from diverse national sources while there are limited options for their harmonisation. Therefore, under certain conditions a more generalised procedure is applied, in particular for country models not supported by national teams, but also when an improved alignment with EU Agricultural Outlook data has to be achieved. Under the “simplified supply and use balances” approach, production data comes from the “Short-term outlook for EU arable crops, dairy and meat markets” (STO) published three times a year (EC, 2017b). It provides most recent available production figures and estimates for the next marketing or calendar year. Import and export data are retrieved from Eurostat at 8-digit level from the dataset “EU trade since 1988 by CN8 (DS-016890)” (Eurostat, 2018a) converted to raw product equivalents. Estimates of use (apparent consumption) at Member State level are derived by closing the balance (see also Salamon and Wolf, 2017). To be able to capture the most recent market price developments, data is often extracted from the European Commission’s “Commodity price dashboard” (EC, 2018b); other prices were retrieved from EUROSTAT (2018b) or national sources.

## 2.4 Baseline Simulation and Validation

The endogenous variables which are commodity balance items and associated prices are projected to a 15-year time horizon by making use of the underlying quantitative and qualitative assumptions on macroeconomic and other exogenous variables. Those variables are harmonised with the assumptions of the EU Agricultural Outlook, and all domestic agricultural policy and trade measures will remain unchanged, as defined under the Agricultural Outlook.

The Member State Outlook provided by AGMEMOD is embedded in the EU Agricultural Outlook. The Agricultural Outlook covers two regions for the total EU as provided in AGLINK, the aggregated EU-15 and the aggregated EU-N13, and a procedure of scaling is applied so that the total of individual country results matches the results for these sub-region totals. Scaling factors on the demand and supply sides will adjust supply and demand in the AGMEMOD model, until the excess supply under AGMEMOD matches the projected excess supply in AGLINK (see Salamon et al., 2017).

The validation of the model-based outcomes is intended to improve AGMEMOD's capacity to generate plausible and sensible market outlooks and to contribute to impact assessment analysis of different policy options. This is achieved by different layers. In the first, an initial validation is carried out by the country teams. Country teams are encouraged to review and improve their country models with help of agricultural market experts within their Member State. Some countries establish sector outlooks based with a suit of different models with aligned assumptions and outcomes checked across models (Berkhout et al., 2011; Offermann et al., 2018). One more formalized approach, mostly for important Member States, is to supply 'expert opinion sheets' to experts consisting of a fact sheet with an integrated questionnaire summarising model outcomes and asking for qualitative feedback ("much too high", "too high", "about right", "too low", "much too low") while at the same time experts are urged for additional information on drivers and game changers. Based on that assessment, further re-estimations and calibrations are conducted. A second phase of validation takes place at European workshops to which experts are invited for discussing and validating AGMEMOD results for the most relevant agri-food commodities. Transcripts of remarks are taken, serving as entry points for further improvements (Salamon et al., 2017).

## 3 The AGMEMOD 2017 Outlook

### 3.1 Baseline Assumptions

The AGMEMOD baseline is driven by assumption on exogenous variables determined outside the model. The baseline assumes normal biophysical and climatic conditions, steady demand and yield trends, and no market disruption (provoked by, for example, the outbreak of animal diseases, food safety issues, extreme weather events). Consequently, the absence of extreme future situations implies relatively smooth market developments, although in reality markets will tend to be more volatile. Therefore, the baseline scenario is not considered as a forecast of future developments of European agri-food markets, but rather as a possible pathway of these markets under conditions marked by unchanged policies, technological progress and a continuation of normal geopolitical, macroeconomic and weather conditions.

Population and economic growth are important drivers for demand and supply developments in agricultural commodity markets. Following the assumptions of Global Insight, population growth is assumed to slow in Europe, mainly because the depopulation trend observed in the EU-N13 partly offsets continued population growth in the EU-15. The EU-28 population growth is roughly stable over projection period (+0.07% per annum), but with different developments in the Member States (see Figure 2).

**Figure 2. Assumption on change in population in EU Member States (% change, 2030 vs. 2010)**

Source: EC 2018c.

With respect to expected future development of macroeconomic conditions like economic growth, inflation and exchange rates, the AGMEMOD Outlook uses the same sources as the EU Agricultural Outlook (EC, 2017a) which itself relies on a combination of the European Commission's short-term outlook, forecasts from IHS Markit and other sources including the International Monetary Fund, the World Bank and the OECD. The GDP growth in the EU, after a period of zero real GDP growth in 2013, has gradually recovered to about 2%. GDP growth at EU-28 levels a rate which reflects diverting GDP growth rates in various Member States. The assumed average annual growth rates for the economies of the EU-15 and EU-N13 aggregates are presented in Figure 3.

**Figure 3. Development on average annual GDP growth rates in the EU (%), 2005-2030**

Source: EC 2017a.

The AGMEMOD baseline adopts the USD/EUR exchange rate development as assumed in EC (2017a). Following the depreciation of the EURO against the US Dollar in the period 2015-2017, recovery of the EURO is expected from 2018 onwards, with an USD/EUR exchange rate of about 1.16 in the year 2021 and increasing to 1.23 in the year 2030 (see Figure 4). Projections of exchange rates of local currencies versus the EURO in the Non-EURO zone EU Member States are also based on EC expectations (EC 2017a).

Figure 4. Assumption on USD/ EUR exchange rate, 2005-2030

Source: EC 2017a.

Regarding the CAP, the baseline outlook includes the following aspects of the CAP 2014-2020 reform<sup>3</sup>:

- Decoupled payments scheme: future budget envelopes are used to calculate average per hectare decoupled payments for EU Member States.
- Voluntary coupled support: Member States can couple up to 8% of their direct payments envelope (in some cases up to 13%) and the corresponding Member State decisions.
- “Greening” of the CAP: the goal is to pay for some public goods produced by farmers when they comply with three specific requirements.
- Maintenance of pasture: it has to be ensured that the ratio of land under permanent grassland to total agricultural area does not decrease by more than 5% (compared with the reference year).
- Ecological focus area: 5% of the farm area must remain un-cropped.
- Expiry of the quota system for sugar and isoglucose in 2017<sup>4</sup>.
- National environmental policies that constrain dairy, pig and poultry production are implicitly taken into account in each Member State, but they are explicitly implemented in the Member State models of The Netherlands (such as the Dutch phosphate reduction plan approved by the European Commission in February 2017) and Denmark.

With regard to international trade negotiations and agreements, the AGMEMOD Outlook assumes a continuation of the current commitments of the Uruguay Round Agreement on

<sup>3</sup> For detailed information on the CAP 2014-2020 reform, see: [http://ec.europa.eu/agriculture/cap-post-2013/index\\_en.htm](http://ec.europa.eu/agriculture/cap-post-2013/index_en.htm)

<sup>4</sup> So far this has been implemented only for Poland and Germany, as the other Member State models do not yet include the sugar market.

Agriculture. No assumptions are taken with respect to a potential outcome of the Doha Development Round. Only free trade agreements (FTAs) already signed and in place are considered, i.e. bilateral and regional agreements still not signed or ratified are not taken into account. The Russian food embargo against imports from EU countries is considered until the end of 2018. The AGMEMOD Outlook takes the assumption that the United Kingdom will remain part of the EU-28 over the whole projection period until 2030, i.e. Brexit — the prospective withdrawal of the United Kingdom from the EU — is not taken into account. This is the case because no specific decisions to the implementation of the Brexit are known.

The outlook version of the AGMEMOD model is calibrated to world market prices and scaled to aggregated production and use presented for the EU-15 and EU-N13 in the EU Agricultural Outlook for 2017-2030 (EC, 2017a).

### 3.2 Results<sup>5</sup>

For the interpretation of the outlook results, it is important to keep in mind that the baseline projections are neither “forecasts” nor “predictions” but are conditional projections based on a well-defined set of assumptions and a set of models of EU agricultural commodity markets in AGMEMOD. As the model structure and parameters are, in general, based on observed data from the past, a more general assumption considers the absence of structural breaks unless specific measures are taken. In addition, in general, projection outcomes tend to be relatively smooth and can be interpreted as medium-term developments, contrasting with the more jagged patterns depicted by observed historical data. But one needs to reflect that historical variations are often produced by unexpected supply or demand shocks in markets due to abnormally favourable or unfavourable weather conditions, wars, or diseases. In addition, unforeseeable policy actions such as bans will make an obvious mark in historical data.

---

<sup>5</sup> The following tables provide results only for a selection of years including 2010, 2015, 2020, 2025 and 2030. The full set of projection results at annual base is available under the following [link](#).
