Any opinions expressed in this paper are those of the author(s) and not those of IZA. Research published in this series may include views on policy, but IZA takes no institutional policy positions. The IZA research network is committed to the IZA Guiding Principles of Research Integrity.

The IZA Institute of Labor Economics is an independent economic research institute that conducts research in labor economics and offers evidence-based policy advice on labor market issues. Supported by the Deutsche Post Foundation, IZA runs the world's largest network of economists, whose research aims to provide answers to the global labor market challenges of our time. Our key objective is to build bridges between academic research, policymakers and society.

IZA Discussion Papers often represent preliminary work and are circulated to encourage discussion. Citation of such a paper should account for its provisional character. A revised version may be available directly from the author.

ABSTRACT

Household Collective Models: Three Decades of Theoretical Contributions and Empirical Evidence*

Household collective models celebrate their thirtieth birthday. The collective approach constitutes, perhaps, the microeconomics topic that has produced the largest number of papers (both published and in working paper/mimeo formats) during the last three decades, beginning with the seminal paper published by P.A. Chiappori in *Econometrica* (Chiappori, 1988). To add to some excellent surveys of household collective models (Strauss et al., 2000; Vermeulen, 2002; Donni and Chiappori, 2011; Chiappori and Mazzocco, 2017), we here perform a bibliographic review of the literature, which includes theoretical contributions, as well as the international empirical evidence related to the collective approach. With respect to the theoretical papers, the collective framework has been used to provide theoretical results for a number of household issues; for example, labour supply, consumption and savings, household production, and intra-household allocation. As for the empirical papers, the international evidence covers the majority of developed and developing countries from all continents.

JEL Classification: D10, J22, Y10

Keywords: household, collective models, Pareto efficiency, sharing rule, labor supply, consumption

* This document was mainly written while Jose Alberto Molina was Visiting Professor at the Department of Economics of Boston College (US), to which he would like to express his thanks for the hospitality and facilities provided. We are very grateful to Pierre-André Chiappori for helpful suggestions. Comments are welcome.

The collective approach celebrates its thirtieth birthday. On this occasion, we present a bibliography that includes all the papers (or at least most of them) inspired by the seminal paper of Pierre-André Chiappori, the founder of the collective approach, "Rational Household Labor Supply", published in 1988. The collective approach to household behavior arose from the hypothesis that (i) each individual in the household has specific preferences and (ii) the outcome of the decision process is Pareto efficient. In spite of important earlier contributions that already used Pareto efficiency as the basis of household behavior models (and which we have not included), the aforementioned paper and its sequel, "Collective Labor Supply and Welfare", published in 1992, introduced original ideas that have opened up new areas of research. We can point out at least three important and original contributions of these two papers:

1. **The Pareto efficiency hypothesis is theoretically justified.** Efficiency is seen as a fundamental axiom, comparable to the classical axioms of consumer theory. It can be challenged, but it remains the benchmark hypothesis. It also replaces the axioms of the Nash solution used in prior models of household behavior. Consequently, the collective model can be seen as the "true" neoclassical model of household behavior, while the unitary model remains a holistic deviation.
2. **Pareto efficiency has two important consequences:**
 - a. **Testability:** Like any other model of household behavior that is susceptible to challenge, the unitary model must be testable from survey data (in Popper's sense). The collective model actually generates restrictions on household behavior that are not satisfied by any other model. These restrictions are comparable to the Slutsky conditions in the unitary case.
 - b. **Identifiability:** In analogy with the unitary model, for which utility functions can be recovered up to a monotonic transformation, the structural components of the model must be recoverable from observable behavior (e.g., demand equations that are estimated from the usual data). Using the efficiency hypothesis, together with auxiliary hypotheses, it can be shown that individual utility functions and the sharing of resources can be recovered from observed behavior. Consequently, the intra-household distribution of resources can be studied by econometricians.
3. **A new technique of proof is proposed.** Identifiability and testability is proven, according to a new technique that will be applied in many other papers.

This bibliography also includes papers that are not directly inspired by the two aforementioned papers, but have benefitted from the new interest by the profession in intra-household bargaining, with these including tests of the multi-person income-pooling hypothesis and multi-utility models of household behavior that include equivalence-scale models. We have included not only published papers, but also a number of books, chapters of books, and a number of unpublished papers that are included in reputable working paper collections. We also restrict the bibliography to "neo-classical" economic literature, even if the idea behind collective models may have been burgeoning outside this limited domain of research. Finally, one of our objectives is also to point out original papers that have been overlooked by the profession.

Despite that we have attempted to be complete and exhaustive, we are conscious that this bibliography does not do justice to some important papers (e.g., on risk sharing, or marriage) that, although they focus on the multiplicity of individuals in the household, are far from the collective approach.
