What beyond oil and gas? Russian trade specialisation in manufactures

Abstract

The objective of the paper is to study Russia's pattern of specialisation in the manufactures trade since 1998. Russia's global trade balance for manufactures is rapidly deteriorating. However, the trade pattern in manufactures should be differentiated according to Russia's main trading partners: the European Union (EU), the Commonwealth of Independent States (CIS) and China. On the basis of trade indicator analysis (revealed comparative advantages and Grubel-Lloyd index of intra-industry trade), we show that Russia is globally disadvantaged in the manufactures trade vis-à-vis the EU and China, and advantaged in the trade with the within the CIS. Russia is managing to expand its manufactured exports to other CIS countries. However, it is gradually losing its role of main supplier of capital goods in the post-Soviet space.

Keywords: international trade, trade specialisation, revealed comparative advantage, intra-industry trade, Russia

What beyond oil and gas? Russian trade specialisation in manufactures

Tiivistelmä

Tässä keskustelualoitteessa tutkitaan erikoistumista Venäjän tehdasteollisuuden tuotteiden viennissä vuodesta 1998 lähtien. Venäjän tehdasteollisuuden tuotteiden kauppataase heikkenee nopeasti. Maan tehdasteollisuuden tuotteiden kauppa kuitenkin vaihtelee kauppakumppanin mukaan. Venäjän suurimmat kauppakumppanit ovat Euroopan unioni (EU), Itsenäisten valtioiden yhteisö (IVY) ja Kiina. Paljastetun suhteellisen edun ja teollisuusalan sisäisen kaupan Grubel-Lloydin indeksin avulla voidaan näyttää, että Venäjä on jäänyt teollisuustuotteiden kaupassaan selvästi jälkeen EU:sta ja Kiinasta. IVY-maiden markkinoilla Venäjä onnistuu selvästi paremmin. Venäjä on kasvattanut tehdasteollisuuden tuotteiden vientiään näille markkinoille. Se on kuitenkin menettämässä merkitystään pääomaintensiivisten tuotteiden pääasiallisena toimittajana IVY-alueella.

Asiasanat: kansainvälinen kauppa, erikoistuminen, paljastettu suhteellinen etu, teollisuusalan sisäinen kauppa, Venäjä

1 Introduction

While the transition reforms of the nineties have achieved their principal goals, which are the passage to a market economy and introduction of private property, the economic costs of transition have been very high. Russia experienced a deeper and longer decline than other economies of Eastern Europe. It lost about 40% of its GDP and 50% of its industrial production in 1991-1998, while investments fell by 80%. The recovery started in 1999, but Russia's GDP reached its pre-transition level only in 2006.

The industrial revival after the crisis of 1998 was based on the effects of the rouble devaluation. It was also backed by the increase in world oil prices. Other authors (Aslund, 2004) have pointed to the progress realised on the path of liberalisation, stabilisation and privatisation, in conformity to Washington consensus prescriptions. In terms of political economy, the recovery can be explained by the emergence of a strong developmental state and the enlargement of the planning horizon of economic actors under the Putin presidency (Garanina, 2007).

The favourable price conditions on the world energy markets are contributing to improving the Russian external equilibrium. Several studies have been undertaken in order to analyse the specialisation pattern of Russia in international trade (notably, Ahrend, 2004; Algieri, 2004). Two elements are commonly noted about the Russian foreign trade structure. These are, firstly, its positive trade balance and, secondly, the high level of dependency on hydrocarbon and other primary product exports. This leads us to conclude that there is a vulnerability in the Russian external balance (notably, in the case of the reversal of price conditions on the world energy markets) and about the risks of the "Dutch Disease" and its negative consequences for the domestic manufacturing industries (Ahrend, 2006; Volchkova, 2006; Oomes, Kalcheva, 2007). However, these analyses don't specify the eventual diversification of specialisation patterns depending on the trade partners, which is especially significant for the trade in manufactured products.

In this paper, we study specifically Russia's trade flows in manufactures. What is the pattern of diversification of Russia's manufactured exports (and on what geographic basis)? What are the major tendencies for the imports of manufactured products? The manufactures-based approach is necessary for understanding the diversification potential of Russian foreign trade and for evaluating the stability potential of the trade balance in

case of a major degradation of price conditions on the world energy and primary commodities markets.

We show the differentiation of Russia's specialisation patterns according to its main partners, which are the European Union (EU), the Commonwealth of Independent States (CIS) and China. While Russia is globally disadvantaged in manufactures trade vis-à-vis the EU and China, it strives to expand its exports of manufactured products towards the CIS. However, its global trade balance of manufactures is rapidly deteriorating.

The second section presents the overview of Russia's manufactures trade. The analysis of the evolution of Russia's global specialisation pattern in manufactures is based on estimates of its revealed comparative advantage (RCA) since 1998. The third section analyses the differentiation of trade patterns by Russia's main trade partners based on RCA and intra-industry trade indices. In section four, we study more closely the dynamics of bilateral trade flows with the CIS, the EU15 and China. Section five concludes the paper.

2 Dynamics of Russia's manufactures trade

2.1 General tendencies

Being one of the main oil and gas exporters in the world, Russia has a strongly positive trade balance which is influenced by world oil price dynamics. Indeed, Russian exports are dominated by fuels and primary products. In 2006, primary commodities accounted for about 75% of Russia's exports, while manufactured goods constituted less than 20% of its exports. In particular, in 2006, fuels represented about 63% of the total exports and ores and metals constituted about 7% (see Table 1). Moreover, while the share of manufactured exports has been declining, the share of primary commodities in Russia's exports has been steadily growing. The latter can be partially explained by the growth of world hydrocarbon prices, which are causing the value of oil and gas exports to drift upwards, the latter stagnating in volume over the last two years.

On the import side, manufactured products dominate, totalling about 75% of the imports in 2006. Primary commodities account for about 20%, of which food items constitute 14%. The main changes in imports over the studied period concern the increase in the manufactures share, from 57% to 75% over the studied period. The major contribution to

the growth in manufactured imports is being made by increasing imports of machinery and transport equipment, rising from 29% to 44% of Russian imports during 1998-2006.

Table 1 Structure of Russian foreign trade (percentage of total exports/imports)

	Exports				Imports			
	1998	2000	2003	2006	1998	2000	2003	2006
Total (SITC 0 to 9), USD billion	72.3	103.1	133.7	301.6	43.7	33.9	57.3	137.7

While Russia's global trade balance is positive, the situation changes dramatically when looking at the manufactures trade taken in isolation. The Russian trade balance for manufactured goods is negative and the disequilibrium is rapidly increasing despite the considerable growth of manufactured exports since 2002 (see Figure 1).

Russian imports of manufactured goods grew by a factor of 5 during the period 1998-2006. The negative trade balance reaches about USD 50 billion in 2006, as compared to a zero (or even slightly positive) balance at the end of the 1990s. Thus, Russia is becoming increasingly exposed to the risk of price volatility concerning its main export products (mainly hydrocarbons and metals).

On the exports side, a more than 100% growth is not spectacular if we take into account the decrease of industrial production in 1991-7 by a factor of 2, and the fact that the Russian GDP reached its pre-transition level only by 2006. Thus, the dynamics of manufactured exports roughly reflects the industrial production pattern of the Russian economy.

The analysis of the evolution of Russian manufactures trade by main product groups (see Table 2) reveals a strong positive dynamic for the export of chemicals and related products (SITC 5), manufactured goods classified chiefly by materials (SITC 6 less 68) and machinery and transport equipment (SITC 7). The latter appears as a highly positive fact. However, on the import side, the growth rates are much stronger, especially for the imports of machinery and transport equipment (SITC 7) and chemicals and related products (SITC 5).

A more detailed study of the evolution of the manufactures trade structure is necessary in order to understand the main patterns of change in recent years.

2.2 Russia's revealed comparative advantages in manufactures

In the tradition of Balassa (1965), the Revealed Comparative Advantage (RCA) index can be represented as (1):

$$\frac{x_{ij}/X_j}{x_{ik}/X_k} \quad (1)$$

where x_{ij}/X_j is the share of product i in the total exports of country j and x_{ik}/X_k is the share of product i in the total world exports.

However, the exports-based method of calculation, which was initially justified by the role of import protection measures for the import values, can lead to misunderstanding. For example, is a country effectively specialised in a product i , if it exports the product i , say, 1.5 times more than the world average, but also imports twice more? Thus, the imports value should be taken into account. Moreover, in the case of Russia, the results will be strongly influenced by the price dynamics for the major export goods. That is, the increase of hydrocarbons prices may lead to a decrease in the share of manufactures in the total value of exports.

Given that, in this study, we use the Normalised Balance index, which can be represented as (2):

$$(X_{ijk}-M_{ijk})/(X_{ijk}+M_{ijk}) \quad (2)$$

where X -exports, M -imports, i -product, j , k -trade partners (the whole world).

The ratio varies between -1 (the product is not exported, revealed comparative disadvantage) and +1 (the product is exported, revealed comparative advantage). The situation of a close-to-zero result (simultaneous exports and imports of the same commodity by both trade partners) reflects intra-industry trade, which will be analysed later in this paper (see section 3.3).

The calculation is based on UN Comtrade statistics (data reported by Russia). The results are presented in Table 3 (see full table in Annex 1).

Table 3 Russia's revealed comparative advantages in manufactures

10 product groups with highest RCA index (SITC)		2000	2006	10 product groups with lowest RCA index (SITC)		2000	2006

Average RCA for manufactured products						0.13	-0.34

Source: UN Comtrade database, SITC Rev. 3, author's calculations. Accessed June 2008.

As seen in Table 3, Russia's trade performances deteriorate during the studied period. The average RCA declines from 0.13 in 2000 to -0.34 in 2006. Russia is disadvantaged for most of the product groups. Inversely, it is advantaged for eight product groups only (in decreasing order): SITC 56: Fertilisers; SITC 51: Organic chemicals; SITC 67: Iron and steel; SITC 52: Inorganic chemicals; SITC 61: Leather, leather manufactures, n.e.s., and dressed furskins; SITC 63: Cork and wood manufactures (excluding furniture); SITC 66:

Non-metallic mineral manufactures, n.e.s.; and SITC 71: Power-generating machinery and equipment.

Almost all the above-mentioned groups, except for power-generating machinery, are semi-products. Furthermore, these are energy-intensive goods. That is, the hydrocarbon endowment of the Russian economy and the applied regulatory policies (notably, the regulation of the internal energy market enabling low internal prices of natural gas) contribute to the economics of the energy-intensive industries.

Finally, the advantage in technology-intensive power-generating machinery weakens through the studied period, reflecting the decline of the technological potential inherited from the planned economy.

However, this picture of Russia's trade specialisation should be differentiated as the trade structure is significantly differentiated depending on the trade partner.

3 Differentiation of specialisation patterns by trade partners

3.1 Russia's trade pattern: an outlook

Three large country blocs can be distinguished within the geographical structure of Russian foreign trade:¹

- 1) The European Union (EU), Russia's main trading partner. The EU15 provide about 40% of Russian foreign trade while the enlarged Union accounts for more than 50% of Russian exports and imports;
- 2) The Commonwealth of Independent States (CIS), which regroups the former republics of the Soviet Union (except the Baltic countries). In 2006, the CIS accounted for only about 15% of Russian foreign trade (18.5% in 2000). To compare, in 1991 the part of the CIS in Russian exports was 55% and 58% of the imports.²
- 3) China as a growing regional power in Asia. Despite the fact that Russian-Chinese bilateral trade has more than quadrupled since the beginning of the 2000s, in 2006, China absorbed only 5.2% of Russian exports and provided 9.4% of

¹ We use the UN Comtrade data unless otherwise stated.

² Interstate Statistical Committee of the CIS, www.cisstat.com.

Russian imports. The share of Russia in Chinese imports was 2.2%, and 1.6% in its exports. The high rates of economic growth in both countries and the stabilisation of their political relations explain the strong development potential for their bilateral trade.

In the coming sections, we analyse the differentiation of Russia's trade in manufactures. The major problem is the quality of statistical data on Russian foreign trade related to the scope of "grey" imports in Russia. The gap between Russia's and its trading partners' statistics is very strong. In particular, Russian imports of manufactured goods seem to be under-valued. However, we observe a gradual improvement of data over the studied period (see Annex 2). Still, Russian-Chinese trade data remains questionable, since in 2006, Russia's manufactured exports to China surpass China's imports from Russia by 1.5 times.

In order to overcome this bias, we use the mirror statistics for the analysis of bilateral trade flows. That is, we calculate the average between the data reported by Russia and by its trading partners.³ Further, we prefer analysing the SITC 2-digit level in order to reduce the errors linked to misclassification.

The first results show that Russia's trade pattern in manufactured products is highly differentiated depending on the trading partner (see Figures 2, 3, 4):

- 1) With other countries in the CIS, Russia has a positive trade balance. Moreover, the balance has been gradually improving since the beginning of the 2000s. Globally, the CIS is the only country group for which Russia is steadily increasing its manufactured exports.
- 2) The EU accounts for the major part of the Russian negative balance in manufactures. Russian manufactured imports from the EU are rapidly increasing.
- 3) The manufactures trade balance with China became negative since 2003. While we are facing a boom of Chinese exports to Russia, Russian exports are globally stagnating. One should also note a 25% decline in Russian exports in 2006, the exports value passing from USD 4 billion to USD 3 billion. On the other hand, China tripled its manufacturing exports to Russia in the last three years. In consequence, the global trade balance with China has become negative for Russia.

³ However, as for the Russia-CIS trade, the mirror data is incomplete. In our study we use the aggregate CIS indicator as reported in the UN Comtrade Database, but note that the direct data from Uzbekistan, Tajikistan and Turkmenistan are lacking. Nevertheless, we consider this fact to be a minor problem as these countries are not Russia's major trade partners in the region.

Figure 2. Russian exports and imports of manufactured goods towards the CIS

3.2 Revealed comparative advantage in bilateral trade by Russia's main trading partners: CIS, EU15, China

Traditional theories of international trade explain trade specialisation by pointing to the differential of relative prices, the latter due to differences in labour productivity (Ricardo approach) or in factor endowments (Heckscher-Ohlin theory). In order to define Russia's specialisation pattern, we calculate the indicator of revealed comparative advantage for bilateral trade as it was defined in the preceding section.⁴

As shown in Table 4, the structure of revealed comparative advantages is strongly differentiated by main Russia's trading partners (see full tables in Annexes 3-5). Russia appears as relatively advantaged in the trade with the CIS while being disadvantaged in the trade relations with the EU. Thus, Russia can be qualified as an intermediate country in the sense of Lassudrie-Duchêne, Mucchielli (1979). According to these authors, a country may be advantaged in a given product vis-à-vis one trading partner while being disadvantaged concerning the same product in its trade relations with another country or country group.

In fact, in the trade with the CIS, Russia possesses revealed comparative advantages for most of the 34 studied product groups. The RCA index is negative only for eight product groups (SITC 84: Articles of apparel and clothing accessories; SITC 73: Metal-working machinery; SITC 85: Footwear; SITC 65: Textile yarn, fabrics, made-up articles, n.e.s., and related products; SITC 82: Furniture, and parts thereof; bedding, mattresses, mattress supports, cushions and similar stuffed furnishings; SITC 52: Inorganic chemicals; SITC 79: Other transport equipment and SITC 67: Iron and steel).

On the contrary, in the trade with the EU15, Russia is clearly disadvantaged. In 2006, it demonstrates a positive RCA index for only six product groups (SITC 56: Fertilisers; SITC 52: Inorganic chemicals; SITC 67: Iron and steel; SITC 51: Organic chemicals; SITC 61: Leather, leather manufactures, n.e.s., and dressed furskins; and SITC 66: Non-metallic mineral manufactures, n.e.s.).

⁴ That is, $(X_{ijk}-M_{ijk})/(X_{ijk}+M_{ijk})$. X-exports, M-imports, i-product, j, k-trading partners (countries).

Table 4 RCA index by Russia's main trading partners

Russia - CIS trade				Russia – EU15 trade				Russia - China trade

The grey area shows strong revealed advantages of Russia.

In the Eastern direction, we observe a degradation of Russia's competitive position towards China. According to the present statistical data, in 2006, Russia has a positive RCA index for seven product groups only. These are SITC 56: Fertilisers; SITC 51: Organic chemicals; SITC 71: Power-generating machinery and equipment; SITC 67: Iron and steel; SITC 64: Paper, paperboard and articles of paper pulp, of paper or of paperboard; SITC 55: Essential oils and resinoids and perfume materials; toilet, polishing and cleansing preparations; and SITC 79: Other transport equipment.

Furthermore, concerning Russia-EU15 and Russia-China trade, the index is strongly positive (over 0.50) for a very small number of product groups. These are mostly chemicals, fertilisers and iron and steel. Also, we note an advantage in power-generating machinery and equipment in Russian-Chinese trade (however being in decline in 2006). Further, within the Russia-CIS trade, Russia is advantaged in office machines and automatic data-processing machines and in medicinal and pharmaceutical products.

On average, Russia's RCA index is slightly improving for the Russia-CIS trade (the average RCA is 0.14 in 2006 as compared to 0.01 in 2000). That is consistent with the increasing positive trade balance of Russia. For the Russia-EU15 and Russia-China relations, we observe the opposite tendency, that is, the decline of the average RCA index in 2000-2006. The decline is especially strong for the Russian-Chinese relations, the RCA passing on the negative side (from +0.31 to -0.59). As for the Russia-EU15 trade, the average RCA is negative while the disadvantage is reinforcing (the RCA decreases from -0.33 to -0.63).

Intra-industry trade analysis is necessary to understand the nature of the trade where the RCA index is close to zero.

3.3 Intra-industry trade

A country's foreign trade may be divided into two parts: i) the "equilibrated" part (the intra-industry trade) and ii) the balance, which reflects inter-industry trade. While the latter can be explained by the traditional theories of international trade (comparative advantage), the intra-industry trade reflects the situation of imperfect competition analysed within modern theories of international trade.

In order to measure the intra-industry trade, we calculate the Grubel-Lloyd index. The GL index is constructed as follows (3):

$$GL = [\{ (X_{ijk} + M_{ijk}) - |X_{ijk} - M_{ijk}| \} / (X_{ijk} + M_{ijk})] * 100 \quad , \quad \text{or}$$

$$GL = [1 - |X_{ijk} - M_{ijk}| / (X_{ijk} + M_{ijk})] * 100 \quad (3)$$

X –exports, M –imports, i-product (industry), j, k – trading partners.

The intra-industry trade is therefore defined as the difference between the total trade ($X_{ik} + M_{ik}$) and the net exports (imports) $|X_{ik} - M_{ik}|$, which reflect the intra-industry part of the trade flows. The index varies between 0 (zero intra-industry trade for the industry i) and 100 (all the trade within the industry i is intra-industry).

The results show that the intra-industry trade measured by the GL index is relatively stronger for the Russia-CIS trade than for the Russia-EU15 or the Russia-China trade. While the intra-industry trade is relatively stable for the Russia-CIS trade, we note a significant decline within the Russia-EU15 trade during 2000-2006, after a rebound in 1998-2000, which can be explained by the decrease in Russia's imports from the EU15 after the 1998 crisis. Finally, the intra-industry component within Russian-Chinese trade tends to decline, but the 2006 data shows a possibility of a rebound (Table 5).

Table 5 Intra-industry trade of manufactured products in 2000-2006

Grubel Lloyd index <i>SITC Rev. 3, 2 digit, average weighted by the trade value</i>	1998	1999	2000	2001	2002	2003	2004	2005	2006
Russia-CIS	80.05	78.89	80.44	81.86	83.48	81.15	77.80	78.73	79.33
Russia-EU15	24.72	38.26	34.46	27.26	22.34	21.51	18.60	17.55	16.79
Russia-China	18.09	14.66	16.80	16.71	14.52	13.73	11.19	11.58	14.32

Source: UN Comtrade database, SITC Rev. 3, author's calculations. Accessed June 2008.

Within the Russia-CIS trade, the intra-industry trade is relatively more intensive for capital goods and semi-products. In 2006, the intra-industry trade is particularly strong (GL index more than 90%, in declining order) for:

SITC 81: Prefabricated buildings; sanitary, plumbing, heating and lighting fixtures and fittings, n.e.s.;

SITC 74: General industrial machinery and equipment, n.e.s., and machine parts, n.e.s.;

SITC 77: Electrical machinery, apparatus and appliances, n.e.s., and electrical parts thereof (including non-electrical counterparts, n.e.s., of electrical household-type equipment);

SIC 67: Iron and steel;

SITC 57: Plastics in primary forms;

SITC 64: Paper, paperboard and articles of paper pulp, of paper or of paperboard;

SITC 79: Other transport equipment;

SITC 72: Machinery specialised for particular industries.

The trade of consumption goods plays a limited role in the Russia-CIS intra-industry trade. The dominance of capital goods in intra-industry trade could testify to a re-constitution of industrial infrastructures in the CIS space. However, the volumes of manufactured trade remain quite limited.

As for the Russia-EU15 trade, the GL index is over 90% only for the group SITC 63: Cork and wood manufactures (excluding furniture).

Within the Russian-Chinese trade, the GL index surpasses 90% for SITC 79: Other transport equipment and SITC 73: Metalworking machinery. For both of these groups, we observe a sharp decline in Russian comparative advantages.

4 Dynamics of exports and imports by trade partner

4.1 Russia-CIS trade

Table 6 presents the dynamic structure of the Russian trade with the CIS (ranked by the growth ratio 2006 to 1998). First of all, one can note a strong increase in exports for most of the product groups. On average, the exports increased by a factor of 3.6 between 1998 and 2006. Among the groups contributing to a considerable part of manufactured exports, we should note the following:

The exports of road vehicles (SITC 78) experienced a five-fold increase between 1998 and 2006, contributing to 13.1% of Russian manufactured exports towards the CIS in 2006. The exports of road vehicles are mainly composed of motor vehicles for the transport of goods and special-purpose motor vehicles (SITC 782), motor cars and other motor vehicles principally designed for the transport of persons (SITC 781), and parts and accessories of the motor vehicles (SITC 784), which comprise respectively 36.5%, 28.0% and 24.2% of the exports of road vehicles in 2006. The exports of lorries (SITC 782) increased in value by a factor of 6.5, and the exports of vehicles (SITC 781) augmented by a factor of 4.7 between 1998 and 2006. However, an important part of this dynamic is explained by price factors. So, in 2006, according to the Russian Ministry of Economic Development and Trade (Minekonomrazvitia, 2007), Russian automobile exports towards the CIS increased in value by 21.4% for cars and by 43.4% for lorries. Measured in quantities, the exports of cars increased only by 3.7%, while the exports of lorries increased by 17.9%.

The exports of iron and steel have increased in value by a factor of 5, reaching 18.5% of the value of Russian manufactured exports towards the CIS in 2006. However, the rapid increase of Chinese steel production and the growth of internal energy prices in Russia could render the competition in this sector more acute.

Machinery exports accounted for about 23% of Russian manufactured exports to the CIS in 2006. The growth rates are close to or less than the average for all manufactured products, but are still significant (ranging from a 2 to 3.5-times increase between 1998 and 2006 depending on the product group). The main items in the Russian machinery exports towards the CIS are SITC 71: Power generating machinery and equipment; SITC 74: General industrial machinery and equipment; SITC 77: Electrical machinery, apparatus and appliances; SITC 79: Other transport equipment and SITC 72: Machinery specialised for particular industries. Each of them contributes about 4-6% of Russia's manufactured exports towards the CIS.

The fact of continued growth in machinery exports lets us suggest a gradual reconstitution of economic (and also political) ties in the post-Soviet space. In fact, the exports of industrial equipment could provide the basis for the restoration of strong and durable links between the productive structures of the CIS countries under the Russian leadership. However, Russia hasn't succeeded in maintaining its role as the main supplier of machinery and transport equipment for the post-Soviet space. Russia's largest CIS partners, Belarus, Ukraine and Kazakhstan, reported an increase between 2000 and 2006 in imports

of machinery and transport equipment (SITC 7) by 3.2; 5.3; and 5.3 times respectively. At the same time, the share of Russia in total imports of machinery and transport equipment (SITC 7) declined from 44% to 28% for Belarus, from 33% to 20% for Ukraine and from 38% to 22% for Kazakhstan.⁵ That means that Russia is gradually losing its role as the principal supplier of machinery and transport equipment for the CIS. Further, the scope of economic partnership within the CIS is limited by its political disintegration.

On the imports side, the value of manufactured imports increased by a factor of 2.5 in 2006 as compared to 1998.

The imports of transport vehicles and equipment registered a strong increase. The imports of SITC 79: Other transport equipment have increased by a factor of 7.3 in 2006 as compared to 1998, reaching 7.6% of Russian manufactured imports from the CIS in 2006. However, the imports of SITC 78: Road vehicles (which account for about 10% of imports) have grown more slowly. In 2006, the imports of road vehicles constituted about 2.2 times the value of imports of 1998. A particularly strong increase in imports occurs in 2006. In absolute terms, according to the Russian Ministry of Economic Development and Trade (Minekonomrazvitia, 2007), in 2006, the imports of cars (in physical quantities) increased by 82.7% and imports of lorries augmented by 7.1%.

SITC 67: Iron and steel is dominant in imports of manufactured products (28% of manufactured imports in 2006, increase in value by 3.3 times in 2006 as compared to 1998).

The part of machinery in manufactured imports from the CIS is comparable to the Russian exports structure (SITC 74: General industrial machinery and equipment, nes, and parts of, nes comprises 6.9% of manufactured imports in 2006; SITC 77: Electric machinery, apparatus and appliances accounts for 6.8%; SITC 72: Machinery specialised for particular industries constitutes 4.5%; and SITC 71: Power generating machinery and equipment 3.6%). However, the growth rates are slightly more moderate than for the exports.

4.2 Russia - EU15 trade

The structure of the Russian exports of manufactured products towards the EU15 (see Table 7) is clearly oriented towards goods in the first stages of processing:

SITC 67: Iron and steel provides about 38% of manufacturing exports in 2006 (that is, the increase in value by a factor of 4.6 in 2006 as compared to 1998);

Another important group is composed of chemicals and fertilisers (SITC 51: Organic chemicals account for 10.7% of manufactured exports in 2006; SITC 52: Inorganic chemicals for 9.1% and SITC 56: Fertilisers for 4.7%);

Finally, SITC 66: Non-metallic mineral manufactures provide about 13% of Russian manufactured exports to the EU15 in 2006.

On the import side, the growth was relatively more significant than for the exports. On average, the manufactured imports from the EU15 increased by a factor of 3.6 in 2006 as compared to 1998, while the exports increased by only 2.6 times during the same period.

Machinery stands for about 30% of the Russian manufactured imports from the EU15. Notably, the main imported products in this group are SITC 74: General industrial machinery and equipment (10.2% of manufactured imports in 2006), SITC 72: Machinery specialised for particular industries (9.2% in 2006), SITC 77: Electric machinery, apparatus and appliances (7% of manufactured imports in 2006). The growth rates are close to or inferior to the average growth rates of the manufactured imports from the EU15.

The imports of other final products and consumption products demonstrate very high growth rates. The imports of SITC 78: Road vehicles registered a spectacular increase (7-fold during the analysed period), reaching approximately 14% of the total manufactured imports from the EU15. Further, SITC 76: Telecommunications, sound recording and reproducing equipment accounts for 6.4% of manufactured imports (increase by a factor of 4.5). SITC 54: Medicinal and pharmaceutical products accounts for 6.5% of manufactured imports in 2006 (increase by a factor of 5.5 in 2006 as compared to 1998).

The rapid growth of imports of final products testifies to the poor competitiveness of Russian domestic producers, who fail to compete effectively with imports.

Table 7 Evolution of Russian trade with the EU15 by product groups, 1998=100%

Russian exports to EU15	2000	2005	2006	Share of manuf exports 2006	Russian imports from EU15	2000	2005	2006	Share of manuf imports 2006

4.3 Russia - China trade

One of the most outstanding features of Russian-Chinese relations is a high dispersion of growth rates for imports and exports of different product groups (Table 8). The growth rates by product group varied between a 1191-fold increase and a 90% decrease for the exports versus a 2-fold to 606-fold increase on the imports side in 2006 as compared to 1998. Partially it can be explained by the poor quality of the statistical data available, but also by a rapidly increasing scope of economic ties.

Russia's manufactured exports towards China are concentrated in three main domains:

- 1) Chemicals and fertilisers account for about 48% of manufactured exports. The exports of SITC 51: Organic chemicals increased by more than seven times between 1998 and 2006, reaching 18.2% of manufactured exports. SITC 56: Fertilisers accounted for more than 28% of exports in 2006 (increase by a factor of 1.8 as compared to 1998).
- 2) SITC 67: Iron and steel provides about 21.8% of Russian manufactured exports to China.
- 3) SITC 71: Power generating machinery and equipment comprises 9.6% of manufactured exports, but the value of exports decreased considerably in the post-1998 crisis years.

On the imports side, the growth rates are very strong. While the value of Russian exports increased by 1.4 times in 1998-2006, Russia's imports from China registered a more than 12-fold increase. Russia imports primarily final goods, that is:

- The category durable goods accounts for an important share of Russian manufactured imports from China (SITC 76: Telecommunications and sound-recording and reproducing apparatus and equipment makes up 14.2% of manufactured imports from China in 2006; SITC 75: Office machines and automatic data-processing machines represents about 7.4% of manufactured imports from China in 2006). One should note very strong growth rates, including in 2006.

Table 8 Evolution of Russian trade with China by product groups, 1998=100%

* - zero exports in 1998.

In absolute terms, the imports of telecommunications and sound-recording and reproducing apparatus and equipment (SITC 76) increased from USD million 24.4 to USD billion 1.9 during 1998-2006. The imports of office machines (SITC 75) passed from USD million 7.3 to USD billion 1.0 during the same period.

- Another important product group is composed of consumption goods, like SITC 84: Articles of apparel and clothing accessories (17.7% of manufactured imports from China in 2006); SITC 85: Footwear (8.2% of manufactured imports from China in 2006). The imports have been increasing rapidly in recent years.
- Finally, the imports of SITC 77: Electric machinery, apparatus and appliances accounted for about 8.8% of Russia's manufactured imports from China in 2006.

5 Conclusion

Russia is globally disadvantaged in manufactures trade and the trade balance for manufactures is rapidly deteriorating. However, when specifying Russia's trade relations according to its main trading partners (the CIS, the EU, China), we note a significant differentiation of specialisation patterns. Russia possesses revealed comparative advantages in manufactures towards the CIS while being disadvantaged in the trade with the EU and China. However, Russia possesses strong potential in order to advance its international specialisation, notably in terms of its human capital or its technological potential. Until now, Russia hasn't managed to capitalise on this potential. In consequence, its benefits from the international trade are limited.

In order to realise its competitive potential, Russia has to face the competition of foreign oligopolistic firms which benefit from numerous advantages like the control of upstream markets, strong financial capacities, governmental support etc. One can suggest strong opportunities for industrial diversification within the CIS while benefiting from industrial links inherited from the Soviet period. However, in economic terms, Russia is losing the CIS markets vis-à-vis European and Asian countries. Moreover, the scope of economic partnership within the CIS is limited given its increasing political disintegration.
