Table A.4: Expansion effects with varied treatment buffers
(Dependent Variable: Growth of GDP per employed person)

	(i) 30 km buffer	(ii) Excluded ring from 15- 30 km
DiD-estimator	-0.005* (0.003)	-0.005 (0.003)
Post-Treat	0.005* (0.003)	0.012*** (0.003)
ln(GDPpe) lagged	-0.295*** (0.012)	-0.004 (0.005)
ln(employment) lagged	-0.080*** (0.022)	-0.150*** (0.013)
ln(Population) lagged	0.127*** (0.031)	0.054 (0.033)
ln(Density) lagged	-0.001** (0.001)	0.087** (0.035)
Constant	0.849*** (0.135)	0.814*** (0.200)
Time Dummies	Y	Y
No. of Groups	271	154
No. of Obs.	4288	2426

Note: ***, **, * denote significance at the 1 %-, 5 %- and 10 %-level. Robust standard errors clustered on county-level in parentheses. Estimations based on DiD-Fixed effects. Column(i) is based on a larger buffer of 30 km, defined in the same manner as described in section 3. This accounts for potential larger spillovers. Column(ii) follows the idea that some economic spillover are at work in the ring between 15 and 30 km around the regional airport. As they may not be very strong it might be wrong to include them in the control treated group, but as they exist in any way, it would be wrong to include them in the control group. Both ideas behind do not seem to play a role, as positive spillover effects are not detected by this definitions. Source: BBR (2011).
