Online survey presentation

First screen	Description of the 1 st job and tasks (see Table A3)
Second screen	Presentation of 1 st vignette for the 1 st job (see Table A4)
Third screen	Presentation of 2 nd vignette for the 1 st job
Fourth screen	Presentation of the 3 rd vignette for the 1 st job
Fifth screen	Presentation of the 4 th vignette for the 1 st job

This procedure was repeated for the other two jobs. The order of the jobs and – within each job – the order of the vignette was randomized.

Experimental robustness

Table S4: Experimental Robustness - Correlation between vignette dimensions

Since the whole vignette universe consists of 307,200 combinations, a D-efficient sub-sample (D-efficiency = 90.07) of 720 vignettes was drawn from the total vignette universe. A d-efficient design maximizes the orthogonality of the profiles and specifies which parameters you want to be able to identify, as some dimensions will be confounded when choosing only a sub-sample of vignettes (Auspurg and Hinz 2015). Our design allows us to estimate all two-way interactions and two three-way interactions. The 720 vignettes were blocked into 180 blocks of 4 vignettes each for each job. These blocks were then randomly distributed to the survey participants. Every participant rated 3 blocks (one for each job) of 4 vignettes, for 12 vignettes. Since we draw a sub-sample of vignettes, the vignettes dimensions are correlated with each other.
