Modeling Strategic-Knowledge-Resource Management Based on Individual Competencies in SMEs

Justyna Patalas-Maliszewska¹, Martin Hochmeister²

ABSTRACT
A number of publications have dealt with the correlation between knowledge-management capability and competitiveness. In the article describing human resources as strategic-knowledge resources, which is motivated by: the concept of effective management of resources in an organization (Sirmon and Hitt, 2003), an enterprise’s unique potential in the form of knowledge and experience (Barney, 1995), and the concept of competence management (Hamel and Prahalad, 1994). This study describes competence and resource management, sharing in the collaborative development and implementation of strategic-knowledge-resource management in SMEs. In this context, strategic-knowledge resources are defined in such a way as to be incorporated into a model of strategic-knowledge-resource management.

KEY WORDS: strategic-knowledge resources, competence management, resource management

Introduction
Nowadays, enterprises perceive knowledge as a strategic resource which contributes to the competitive dominance of an enterprise. Small and medium-sized enterprises (SMEs) play a critical role in creating work places and, in a more general sense, they also constitute factors in social stability and economic development. However, given the limited guarantees they can offer, SMEs often encounter difficulties in obtaining capital or credit as well as the fact that they typically have limited access to information concerning new technologies and potential markets.

References
Liu et al. (2001) suggested that taking advantage of knowledge management could stimulate employee potential and accelerate the integration of employee knowledge. Introducing knowledge management has become inevitable for enterprises, which need to survive in a competitive environment. The respect and adoption of the intelligence of each employee is the key to continuous company management (Davenport and Prusak, 1998). Nonaka and Takeuchi (1995) defined tacit knowledge as a kind of personal characteristic that is too abstract to transfer, one which cannot be expressed using words.

Many studies have focused on knowledge-management strategies from an organisational perspective (Bar-
Modeling Strategic-Knowledge-Resource Management Based on Individual Competencies in SMEs

This study describes competence and resource management, sharing in the collaborative development and implementation of strategic-knowledge-resource management in SMEs. In this context, strategic-knowledge resources are defined in such a way as to be incorporated into a model of strategic-knowledge-resource management.

1. Strategic-knowledge resources

Resources are clearly important to the performance of a firm. Yet, according to the resource management, the issue of whether or not an organisation gains a competitive advantage and any associated returns depends on the strategic planning used to leverage those resources (Chrisman et al., 2003; McGrath and MacMillan, 2000).

Therefore, a firm's level of strategic planning may impact the degree, to which altruism and human and technological resources affect performance. Specifically, strategic planning may improve the positive effects of technological and human resources on the performance of a firm because the long-term nature of SMEs (especially small–family firms) allows them to strategically plan the dedication of resources required for innovation and risk taking (Zahra et al., 2004).

To define a company's strategic-knowledge resources, it is essential to understand the characteristics of competence and resource management.

1.1. Competence management

The significance of competence management in knowledge-intensive businesses is well-established. As a subdivision of knowledge management, competence management deals with the knowledge of individuals, i.e. their competencies. The capabilities of individuals to accomplish a task are often referred to as qualifications, skills, competencies or other similar terms. However, in literature, there is an explicit difference between these concepts. The concept of a competence is represented by a combination of knowledge, behaviour and skills, that gives an individual the potential to perform a task effectively (Draganidis and Mentzas, 2006).

The aim of competence management is to plan, implement and evaluate initiatives that ensure that the proper competencies are available to a company, which requires them to achieve its business objectives (Nordhaug, 1993). In order to support this task, Berio and...
Harzallah (2005) define four processes for competence management:

1. competence identification to define the required competence;
2. competence assessment to determine if a competence has been acquired;
3. competence acquisition to plan how required competences can be acquired;
4. competence usage to systematically utilise knowledge about competencies for the benefit of an organisation.

To preserve a company’s competitive edge, it is an inevitable necessity that a competence-management system be developed. In general terms, competence management operates on two levels: the macro- and the micro-. The former is concerned with core competencies and is controlled by business management. Thereby, a core competence is understood as the total collective knowledge and capabilities that reside in an organisation (Hamel and Prahalad, 1994). On the micro-level, led by human-resource management, the focus lies on the competencies of individual employees. The competencies a company requires to meet its strategic goals are transformed from the macro- to the micro-level. Inversely, existing competencies on the micro-level are exchanged via business management to support strategy design.

1.2. Resource management

Resource management is critical to the management of a firm and the gaining of a competitive advantage (Chrisman et al., 2003). In particular, a human resource can act as an important strategic resource that can lead to a distinct advantage. According to a resource-based view, firms can develop unique characteristics that allow them to gain a sustainable competitive advantage, thus positively affecting their performance. A further element of the resource-based view is that resources alone do not confer a competitive advantage. Firms must also allocate resources for strategic activities, deploy them effectively to obtain a sustainable competitive advantage and accomplish strategic objectives. Therefore, in order to succeed, firms must develop resources that cannot be easily imitated and are firm-specific, embedded in the organisation and non-transferable (Makadok, 2001).

Enterprises functioning in a market economy have to implement changes in the systems of organisation and management that they use. In economic practice, making a decision in an enterprise is typically conditioned by the actions of competitors and changing environmental factors, e.g. technical progress and the results of research. The added value for SMEs can be defined as knowledge, the skills and abilities of employees, social relations, know-how, and effective investment in intellectual capital. Enterprises, which invest in human capital, usually achieve a competitive advantage because of their workers’ readiness to learn and qualify, and also thanks to effective information and communication transfer (Edvinsson and Malone, 2001).

While resources are important to the performance of a firm, according to a resource-based view, whether or not an organisation gains a competitive advantage and any associated returns, depends on the strategic planning used to leverage those resources (Chrisman et al., 2003; McGrath and MacMillan, 2000).

The need to describe a strategic-knowledge resource is motivated by the concept of resource management (Sirmon and Hitt, 2003) as well as competence management (Berio and Harzallah, 2005) – see Fig. 1.

2. Modeling strategic-knowledge-resource management

To facilitate the use of the model of strategic-knowledge-resource management in SMEs, we build a reference model (Patalas-Maliszewska and Werthner, 2010). For SMEs, which belong to the reference model, we can define the value of strategic-knowledge resources (the so-called personnel usefulness function).

The business processes to be modeled are activities, which focus on sales in SMEs. We can distinguish the description of workplaces and the value of strategic-knowledge resources: the so-called personnel usefulness function (see Fig. 1). This function is defined for each employee who realises a determined set of business processes (Patalas-Maliszewska and Werthner, 2010).

The personnel usefulness function (see Fig. 1) describes the strategic knowledge resource in SMEs. We distinguish the strategic knowledge resource in the sale are in SME based on the identification of business processes and their characteristics in SMEs:

- m1 - Sales Director
- m2 - Sales Specialist
- m3 - Marketing Specialist
- m4 - Regional Assistant
- m5 - Product Manager
Figure 1. Strategic Knowledge Resource in SMEs

Strategic Knowledge Resource: personnel SME usefulness function \( W_{\text{m}} \), for the m-th employee in the SME (Patalas-Maliszewska, 2009):

\[
W_{\text{m}} = f_1(GK) + f_2(PK) + f_3(A) + f_4(E) + f_5(P) + f_6(C) + f_7(P),
\]

where: \( n, m \in N \), where:
- \( f_1(GK) \) – the general knowledge function for the m-th employee in SME, where: \( GK \in R \) and \( 0 \leq f_1(GK) \leq 5 \),
- \( f_2(PK) \) – the professional knowledge function for the m-th employee in SME, where: \( PK \in R \) and \( 0 \leq f_2(PK) \leq 5 \),
- \( f_3(A) \) – the professional abilities function for the m-th employee in SME, where: \( A \in R \) and \( 0 \leq f_3(A) \leq 5 \),
- \( f_4(E) \) – the experience function for the m-th employee in SME, where: \( E \) – is a synthetic index of experience for the m-th employee in SME binding the factors \( d_i \):

\[
E = \frac{\sum d_i}{3}
\]

where: \( d_1 \) - year of work, \( d_2 \) - age of employee, \( d_3 \) - number of realized projects. Each indicator \( f_4(E) \) is assessed on a point scale of \((0 - 5)\) and \( 0 \leq f_4(E) \leq 5 \),
- \( f_5(P) \) – the patents function for the m-th employee in SME, where: \( P \) - synthetic index of patents for the m-th employee binding the factors \( e_i \):

\[
E = \frac{\sum e_i}{4}
\]

where: \( e_1 \) - number of patents, \( e_2 \) - value of investment of new patents, \( e_3 \) - value of copyright, \( e_4 \) - number of projects, which are awaiting for patents. Each indicator \( f_5(P) \) is assessed on a point scale \((0 - 5)\) and \( 0 \leq f_5(P) \leq 5 \),
- \( f_6(C) \) – the clients function for the m-th employee in SME, where: \( C \) - synthetic index of clients for the m-th employee binding the factors \( k_i \):

\[
E = \frac{\sum k_i}{3}
\]

where: \( k_1 \) - number of all clients, \( k_2 \) - number of permanent clients, \( k_3 \) - number of transactions. Each indicator \( f_6(C) \) is assessed on a point scale \((0 - 5)\) and \( 0 \leq f_6(C) \leq 5 \),
- \( f_7(P) \) – the m-th employee’s personality in an SME, where: \( P \in R \) and \( 0 \leq f_7(P) \leq 5 \).

Source: own study
It was possible to receive indispensable data on account of the value personnel usefulness function from companies belonging to the reference model of SME by interview in each enterprise. The next step involves a survey in the selected SMEs, which was performed by interview in 10 companies in line with the reference model. Based on the result research in the sales area in SMEs, the set of values of the strategic-knowledge resources of a company is defined according to a reference model SME (see Table 1).

Table 1. The set of values of the strategic-knowledge resources of a company according to a reference model SME

In order to present our model of strategic-knowledge-resource management in SMEs, we introduced the definition of strategic-knowledge resources (see Fig. 1). The framework is based on the premise that the focus should be placed on the way individual knowledge is used to build the critical capabilities a company requires in order to succeed—on the core processes and activities that enable it to compete.

The framework starts with the identification and the categorisation of strategic-knowledge resources. Work can be evaluated along two dimensions. The first is the level of comparison and assessment, i.e. the degree to which employees need to collaborate and interact. The second is forecasting — the degree, to which employees need to contribute towards the growth of innovative firms. Using these two factors, we have identified the following model.

Using the defined model is crucial in regards to the competitiveness of a company. Integration of resource and competence management in a company is the basis for its development strategy. In further works, the author’s Advisory Computer System for Forecasting the Efficiency of Strategic-Knowledge Resources in Small and Medium Enterprises will be presented.

Conclusions

The concept of strategic knowledge resources encompasses the employees of enterprises together with their education, experience, professional qualifications, work performance, interpersonal relationships and communication skills. Both resource and competence management can be conceived as complementary elements of the complex strategic-knowledge-resource management formation process.

This paper is aimed at new ideas to help determine knowledge resources in SMEs. SMEs should find special support for increasing and improving their knowledge. Such knowledge can then act as a driving force
behind the operational stability and the establishment of a permanent competitiveness in the market.

Research is necessary to create economic growth and social development. Creating the author’s Advisory Computer System for Forecasting the Efficiency of Strategic-Knowledge Resources in Small and Medium Enterprises will provide an advantageous tool, which can be used to promote the practice of knowledge management.
