August, 2007

Revised August, 2009

*Earlier versions of this paper were presented at the NSF/NBER conference on weak and/or many instruments at MIT in 2003, and at the 2004 winter meetings of the Econometric Society in San Diego, where conference participants provided many useful comments and suggestions. Particular thanks are owed to D. Ackerberg, D. Andrews, J. Angrist, M. Caner, M. Carrasco, P. Guggenberger, J. Hahn, G. Imbens, R. Klein, M. Moriera, G.D.A. Phillips, P.C.B. Phillips, and J. Stock for helpful discussions.
Abstract

This paper derives the limiting distributions of alternative jackknife IV (JIV) estimators and gives formulae for accompanying consistent standard errors in the presence of heteroskedasticity and many instruments. The asymptotic framework includes the many instrument sequence of Bekker (1994) and the many weak instrument sequence of Chao and Swanson (2005). We show that JIV estimators are asymptotically normal; and that standard errors are consistent provided that $\sqrt{\frac{K_n}{r_n}} \to 0$, as $n \to \infty$, where $K_n$ and $r_n$ denote, respectively, the number of instruments and the rate of growth of the concentration parameter. This is in contrast to the asymptotic behavior of such classical IV estimators as LIML, B2SLS, and 2SLS, all of which are inconsistent in the presence of heteroskedasticity, unless $\frac{K_n}{r_n} \to 0$. We also show that the rate of convergence and the form of the asymptotic covariance matrix of the JIV estimators will in general depend on strength of the instruments as measured by the relative orders of magnitude of $r_n$ and $K_n$. 
1 Introduction

It has long been known that the two-stage least squares (2SLS) estimator is biased with many instruments (see e.g. Sawa (1969), Phillips (1983), and the references cited therein). Due in large part to this problem, various approaches have been proposed in the literature for reducing the bias of the 2SLS estimator. In recent years there has been interest in developing procedures based on using “delete-one” fitted values in lieu of the usual first-stage OLS fitted values, as the instruments employed in second stage estimation. A number of different versions of these estimators, referred to as jackknife instrumental variables (JIV) estimators, have been proposed and analyzed by Phillips and Hale (1977), Angrist, Imbens, and Krueger (1999), Blomquist and Dahlberg (1999), Ackerberg and Deveraux (2003), Davidson and MacKinnon (2006), and Hausman, Newey, Woutersen, Chao, and Swanson (2007).

The JIV estimators are consistent with many instruments and heteroskedasticity of unknown form, while other estimators, including limited information maximum likelihood (LIML) and bias corrected 2SLS (B2SLS) estimators are not (see e.g. Bekker and van der Ploeg (2005), Ackerberg and Deveraux (2003), Chao and Swanson (2006), and Hasuman et al. (2007)). The main objective of this paper is to develop asymptotic theory for the JIV estimators in a setting that includes the many instrument sequence of Kunitomo (1980) and Bekker (1994) and the many weak instrument sequence of Chao and Swanson (2005). To be precise we show that JIV estimators are consistent and asymptotically normal when \( \sqrt{\frac{K_n}{r_n}} \to 0 \), as \( n \to \infty \), where \( K_n \) and \( r_n \) denote, the number of instruments and the rate of growth of the so-called concentration parameter, respectively. In contrast, consistency of LIML and B2SLS generally requires that \( \frac{K_n}{r_n} \to 0 \), as \( n \to \infty \), meaning that the number of instruments is small relative to identification strength. We show that both the rate of convergence of the JIV estimator and the form of its asymptotic covariance matrix depends on how weak the available instruments are, as measured by the relative order of magnitude of \( r_n \) vis-à-vis \( K_n \). We also show consistency of standard errors under heteroskedasticity and many instruments.

Hausman et. al. (2007) also consider a jackknife form of LIML that is slightly more difficult to compute but is asymptotically efficient relative to JIV under many weak instruments and homoskedasticity. Hausman et. al. (2007) also propose a jackknife version of the Fuller (1977) that has fewer outliers. With heteroskedasticity any of the estimators may outperform the others, as
shown in Monte Carlo examples in Hausman et. al. (2007).

In the process of showing the asymptotic normality of JIV, this paper gives a central limit theorem for quadratic (and, more generally, bilinear) forms associated with an idempotent matrix. This theorem can be used to study estimators other than JIV. For example, it has been used in Hausman et al. (2007) to derive the asymptotic properties of the jackknife versions of LIML and Fuller (1977) estimators.

This paper is a substantially altered and revised version of Chao and Swanson (2004), in which we now allow for the many instrument sequence of Kunitomo (1980), Morimune (1983) and Bekker (1994); and in which we give a refined version of the central limit theorem from the earlier paper.

The rest of the paper is organized as follows. Section 2 sets up the model and describes the estimators and standard errors. Section 3 lays out the framework for the asymptotic theory and presents the main results of our paper. Section 4 comments on the implications of these results, and concludes. All proofs are gathered in an appendix.

2 The Model and Estimators

The model we consider is given by

\[
\begin{align*}
    y_{n \times 1} &= X_{n \times G \times 1} \delta_0 + \varepsilon_{n \times 1}, \\
    X &= \Upsilon + U,
\end{align*}
\]

where \( n \) is the number of observations, \( G \) is the number of right-hand side variables, \( \Upsilon \) is a matrix of observations on the reduced form, and \( U \) is the matrix of disturbance observations. For the asymptotic approximations, the elements of \( \Upsilon \) will be implicitly allowed to depend on \( n \), although we suppress dependence of \( \Upsilon \) on \( n \), for notational convenience. Estimation of \( \delta_0 \) will be based on an \( n \times K \) matrix, \( Z \), of instrumental variable observations with \( \text{rank}(Z) = K \). Let \( Z = (\Upsilon, Z) \), and assume that \( E[\varepsilon|Z] = 0 \) and \( E[U|Z] = 0 \).

This model allows for \( \Upsilon \) to be a linear combination of \( Z \) (i.e. \( \Upsilon = Z\pi \), for some \( K \times G \) matrix \( \pi \)). The model also allows for \( Z \) to approximate the reduced form. Furthermore, some columns of \( X \) may be exogenous, with the corresponding column of \( U \) being zero. For example, let \( X'_i, \Upsilon'_i, \) and \( Z'_i \) denote the \( i^{th} \) row (observation) for \( X, \Upsilon, \) and \( Z \), respectively. We could let \( \Upsilon'_i = \phi_0(w_i) \) be a vector of unknown functions of a vector \( w_i \) of underlying instruments and let
\( Z_i = (p_{1K}(w_i), \ldots, p_{KK}(w_i))^\prime \), for approximating functions \( p_{kK}(w) \), such as power series or splines. In this case, linear combinations of \( Z_i \) may approximate the unknown reduced form (e.g. as in Newey (1990)).

To describe the estimators, let \( P = Z(Z'Z)^{-1}Z' \) and \( P_{ij} \) denote the \( i, j \) element of \( P \). Additionally, let \( \Pi_{-i} = (Z'Z - Z_{i}Z_{i}')^{-1}(Z'X - Z_{i}X_{i}') \) be the reduced form coefficients obtained by regressing \( X \) on \( Z \) using all observations except the \( i^{th} \). The JIV estimator of Phillips and Hale (1977) is obtained as

\[
\hat{\delta} = \left( \sum_{i=1}^{n} \Pi'_{-i}Z_{i}X_{i}' \right)^{-1} \sum_{i=1}^{n} \Pi'_{-i}Z_{i}y_{i}.
\]

Using standard results on recursive residuals, it follows that

\[
\Pi'_{-i}Z_{i} = (X'Z(Z'Z)^{-1}Z_{i} - P_{ii}X_{i}) / (1 - P_{ii}) = \sum_{j \neq i} P_{ij}X_{j} / (1 - P_{ii}).
\]

Then, we have that

\[
\hat{\delta} = \hat{H}^{-1} \sum_{i \neq j} X_{i}P_{ij}(1 - P_{jj})^{-1}y_{j}, \quad \hat{H} = \sum_{i \neq j} X_{i}P_{ij}(1 - P_{jj})^{-1}X_{j}'.
\]

The JIV estimator proposed by Angrist and Imbens (1999), their JIVE2, has a similar form, except that \( \Pi_{-i} = (Z'Z)^{-1}(Z'X - Z_{i}X_{i}') \) is used in place \( \Pi_{-i} \). It is given by

\[
\hat{\delta} = \hat{H}^{-1} \sum_{i \neq j} X_{i}P_{ij}y_{j}, \quad \hat{H} = \sum_{i \neq j} X_{i}P_{ij}X_{j}'.
\]

To explain why JIV is a consistent estimator it is helpful to consider JIV as a minimizer of an objective function. As usual, the limit of the minimizer with be the minimizer of the limit under appropriate regularity conditions. We will focus on \( \hat{\delta} \) to simplify the discussion. The estimator \( \hat{\delta} \) satisfies \( \hat{\delta} = \arg \min_{\delta} \hat{Q}(\delta) \), where

\[
\hat{Q}(\delta) = \sum_{i \neq j} (y_{i} - X_{i}'\delta)P_{ij}(y_{j} - X_{j}'\delta).
\]

Note that the difference of the 2SLS objective function \( (y - X'\delta)P(y - X'\delta) \) and \( \hat{Q}(\delta) \) is \( \sum_{i=1}^{n} P_{ii}(y_{i} - X_{i}'\delta)^2 \). This is a weighted least squares object that is a source of bias in 2SLS because its expectation is not minimized at \( \delta_{0} \) when \( X_{i} \) and \( \varepsilon_{i} \) are correlated. This does not vanish asymptotically relative to \( \hat{Q}(\delta) \) under many (or many weak) instruments, leading to inconsistency of 2SLS. When observations are mutually independent all of the inconsistency is caused by this term, so that removing it to form \( \hat{Q}(\delta) \) makes \( \hat{\delta} \) consistent.
To explain further, consider the JIV objective function $\hat{Q}(\delta)$. Note that for $\tilde{U}_i(\delta) = \varepsilon_i - U'_i(\delta - \delta_0)$

$$\hat{Q}(\delta) = \hat{Q}_1(\delta) + \hat{Q}_2(\delta) + \hat{Q}_3(\delta), \quad \hat{Q}_1(\delta) = \sum_{i \neq j} (\delta - \delta_0)\gamma_{ij}(\delta - \delta_0),$$

$$\hat{Q}_2(\delta) = -2 \sum_{i \neq j} \tilde{U}_i(\delta) P_{ij} \gamma'_{ij}(\delta - \delta_0), \quad \hat{Q}_3(\delta) = \sum_{i \neq j} \tilde{U}_i(\delta) P_{ij} \tilde{U}_j(\delta).$$

Then by $E[\tilde{U}_i(\delta)|Z] = 0$ and independence of observations we have $E[\hat{Q}(\delta)|Z] = Q_1(\delta)$. Under the regularity conditions below, $\sum_{i \neq j} \gamma_{ij} P_{ij} \gamma'_{ij}$ is positive definite asymptotically, so $Q_1(\delta)$ is minimized at $\delta_0$. Thus, the expectation $Q_1(\delta)$ of $\hat{Q}(\delta)$ is minimized at the true parameter $\delta_0$, so that, in the terminology of Han and Phillips (2006), the many instrument "noise" term in the expected objective function is identically zero.

For consistency of $\hat{\delta}$ it is also necessary that the stochastic components of $\hat{Q}(\delta)$ do not dominate asymptotically. The size of $\hat{Q}_1(\delta)$ (for $\delta \neq \delta_0$) is proportional to the concentration parameter, that we denote by $r_n$. It turns out that $\hat{Q}_2(\delta)$ has size smaller than $\hat{Q}_1(\delta)$ asymptotically but $\hat{Q}_3(\delta)$ is $O_p(\sqrt{K_n})$ (the proof of Lemma A1 shows that the variance of $\hat{Q}_3(\delta)$ is proportional to $K_n$). Thus, to ensure that the expectation of $\hat{Q}(\delta)$ dominates the stochastic part of $\hat{Q}(\delta)$ it suffices to impose the restriction $\sqrt{K_n}/r_n \rightarrow 0$, which we do throughout the asymptotic theory. This condition was formulated in Chao and Swanson (2005).

The estimators $\tilde{\delta}$ and $\hat{\delta}$ are consistent and asymptotically normal with heteroskedasticity, under the regularity conditions we impose, including $\sqrt{K_n}/r_n \rightarrow 0$. In contrast, consistency of LIML and Fuller (1977) requires $K_n/r_n \rightarrow 0$, when $P_{ii}$ is asymptotically correlated with $E[X_i\varepsilon_i|Z]/E[\varepsilon_i^2|Z]$, as discussed in Chao and Swanson (2004) and Hausman et al. (2007); as does consistency of the bias corrected 2SLS estimator of Donald and Newey (2001), when $P_{ii}$ is asymptotically correlated with $E[X_i\varepsilon_i|Z]$, as discussed in Ackerberg and Deveraux (2003). Thus, JIV estimators are robust to heteroskedasticity and many instruments (when $K_n$ grows as fast as $r_n$), while LIML, Fuller (1977), or bias corrected 2SLS estimators are not.

Hausman et. al. (2007) also consider a JIV form of LIML, obtained by minimizing $\hat{Q}(\delta)/[(y - X\delta)'(y - X\hat{\delta})]$. The sum of squared residuals in the denominator makes computation somewhat more complicated though, like LIML, it has an explicit form in terms of the smallest eigenvalue of a matrix. This JIV form of LIML is asymptotically efficient relative to $\hat{\delta}$ and $\tilde{\delta}$ under many weak instruments and homoskedasticity. With heteroskedasticity $\hat{\delta}$ and $\tilde{\delta}$ may perform better than this estimator, as shown by in Monte Carlo examples in Hausman et. al. (2007).
(2007) also propose a jackknife version of the Fuller (1977) estimator that has fewer outliers.

To motivate the form of the variance estimator for \( \hat{\delta} \) and \( \tilde{\delta} \), note that for \( \xi_i = (1 - P_{ii})^{-1} \varepsilon_i \), substituting \( y_i = X'_i \delta_0 + \varepsilon_i \) in the equation for \( \tilde{\delta} \) gives

\[
\tilde{\delta} = \delta_0 + \bar{H}^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j.
\]

(1)

After appropriate normalization, the matrix \( \bar{H}^{-1} \) will converge and a central limit theorem will apply to \( \sum_{i \neq j} X_i P_{ij} \xi_j \). This will lead to a sandwich form for the asymptotic variance. Here \( \bar{H}^{-1} \) can be used to estimate the outside terms in the sandwich. The inside term, which is the variance of \( \sum_{i \neq j} X_i P_{ij} \xi_j \), can be estimated by dropping terms that are zero from the variance, removing the expectation, and replacing \( \xi_i \) by an estimate, \( \tilde{\xi}_i = (1 - P_{ii})^{-1} (y_i - X'_i \hat{\delta}) \). Using the independence of the observations, \( E[\varepsilon_i | Z] = 0 \), and the exclusion of the \( i = j \) terms in the double sums, it follows that

\[
E[\sum_{i \neq j} X_i P_{ij} \xi_j (\sum_{i \neq j} X_i P_{ij} \xi_j)' | Z] = E[\sum_{i,j} \sum_{k \notin \{i,j\}} P_{ik} P_{jk} X_i X_j' \xi_k^2 + \sum_{i \neq j} P_{ij}^2 X_i \xi_i X_j' \xi_j | Z].
\]

By removing the expectation and replacing \( \xi_i \) by \( \tilde{\xi}_i \) we obtain that

\[
\tilde{\Sigma} = \sum_{i,j} \sum_{k \notin \{i,j\}} P_{ik} P_{jk} X_i X_j' \tilde{\xi}_k^2 + \sum_{i \neq j} P_{ij}^2 X_i \tilde{\xi}_i X_j' \tilde{\xi}_j.
\]

The estimator of the asymptotic variance of \( \tilde{\delta} \) is then given by

\[
\tilde{V} = \bar{H}^{-1} \tilde{\Sigma} \bar{H}^{-1}.
\]

This estimator is robust to heteroskedasticity, as it allows \( Var(\xi_i | Z) \) to vary over \( i \) and \( E[X_i \varepsilon_i | Z] \) to vary over \( i \).

An asymptotic variance estimator for \( \hat{\delta} \) can be formed in an analogous way. Let \( \hat{\varepsilon}_i = y_i - X'_i \hat{\delta} \)
and

\[
\hat{\Sigma} = \sum_{i,j} \sum_{k \notin \{i,j\}} P_{ik} P_{jk} X_i X_j' \hat{\varepsilon}_k^2 + \sum_{i \neq j} P_{ij}^2 X_i \hat{\varepsilon}_i X_j' \hat{\varepsilon}_j.
\]

The variance estimator for \( \hat{\delta} \) is then given by

\[
\hat{V} = \hat{H}^{-1} \hat{\Sigma} \hat{H}^{-1}.
\]

Here \( \hat{H} \) is symmetric because \( P \) is symmetric, so that a transpose is not needed for the third matrix in \( \hat{V} \).
3 Many Instrument Asymptotics

The asymptotic theory we give combines the many instrument asymptotics of Kunitomo (1980), Mormune (1983), and Bekker (1994) with the many weak instrument asymptotics of Chao and Swanson (2005). All of our regularity conditions are conditional on $Z = (\Upsilon, Z)$. To state the regularity conditions, let $Z_i, \epsilon_i, U_i,$ and $\Upsilon_i$ denote the $i^{th}$ row of $Z, \epsilon, U,$ and $\Upsilon,$ respectively.

**Assumption 1:** $K = K_n \rightarrow \infty$, $Z$ includes among its columns a vector of ones, and there is a positive constant $C < 1$, such that for all $n$ large enough with probability one, $\text{rank}(Z) = K$ and $P_{ii} \leq C,$ ($i = 1, ..., n$).

In this paper, $C$ is the generic notation for a positive constant that may be bigger or less than one. Hence, although in Assumption 1, $C$ is taken to be less than 1, in other parts of the paper, it might not be. The restriction that $\text{rank}(Z) = K$ is a normalization that requires excluding redundant columns from $Z$. It can be verified in particular cases. For instance, when $w_i$ is a continuously distributed scalar, $Z_i = p^K(w_i),$ and $p_K(w) = w^{k-1},$ it can be shown that $Z'Z$ is nonsingular with probability one for $K < n$. The condition $P_{ii} \leq C < 1$ implies that $K/n \leq C,$ because $K/n = \sum_{i=1}^{n} P_{ii}/n \leq C.$

Let $\lambda_{\text{min}}(A)$ denote the smallest eigenvalue of a symmetric matrix $A$.

**Assumption 2:** $\Upsilon_i = S_n z_i / \sqrt{n}$ where $S_n = \tilde{S} \text{diag}(\mu_{1n}, ..., \mu_{Gn})$ and $\tilde{S}$ is nonsingular. Also, for each $j$ either $\mu_{jn} = \sqrt{n}$ or $\mu_{jn}/\sqrt{n} \rightarrow 0$, $\mu_n = \min_{1 \leq j \leq G} \mu_{jn} \rightarrow \infty$, and $\sqrt{K_n}/\mu_n^2 \rightarrow 0$. Also, there is $C > 0$ such that with probability one $\|\sum_{i=1}^{n} z_i z_i' / n\| \leq C$ and $\lambda_{\text{min}}(\sum_{i=1}^{n} z_i z_i' / n) \geq C,$ for $n$ sufficiently large.

The $S_n$ matrix in Assumption 2 determines the convergence rate of the estimators. We will show that $S'_n(\tilde{\delta} - \delta_0)$ and $S'_n(\tilde{\delta} - \delta_0)$ are asymptotically normal under conditions given here. The $S_n$ matrix has a complicated form that seems necessary to cover important cases, as discussed below. However, one need not even know the form of $S_n$ to perform inference. Under the conditions given here the standard errors we have provided can be used to do large sample inference in the usual way without knowing the form of $S_n$, as shown in Theorem 5 below.

Assumption 2 and the $S_n$ matrix are designed to accommodate a linear model where included instruments (e.g. a constant) have fixed reduced form coefficients and excluded instruments have
coefficients that can shrink as the sample size grows. Such a model has a linear structural equation of the form

$$y_i = Z_i' \delta_1 + X_i' \delta_2 + \varepsilon_i$$

where $Z_i$ is a $G_1 \times 1$ vector of included instruments (e.g. a constant) and $X_i$ is a $G_2 \times 1$ vector of endogenous variables with $G_1 + G_2 = G$. Let the reduced form be partitioned conformably with $\delta$, $Y_i = (Y_{i1}', Y_{i2}')'$ and $U_i = (U_{i1}', U_{i2}')'$. The corresponding reduced form for the included instruments is $Z_i = \tilde{Y}_i$ with $U_i = 0$. Suppose that the reduced form for $X_i$ is

$$X_i = U_i' \gamma + \varepsilon_i,$$

where $\gamma$ are instruments that are excluded from the structural equation and $\mu_n \leq \sqrt{n}$. Here any reduced form coefficients in $\gamma$ are subsumed in $U_i$. Let $\gamma_i = (Z_i', \gamma_i)'$ and impose Assumption 2, so that the second moment matrix of $\gamma$ is bounded and bounded away from zero. This is a normalization that makes the strength of identification of $\delta^2$ be determined by $\mu_n$. Indeed, $1/\mu_n$ will be the convergence rate for estimators of $\delta^2$. Assumption 2 also allows for a diagonal matrix in place of $(\mu_n/\sqrt{n}) I$, which would correspond to different convergence rates for estimators of different components of $\delta^2$. In this example we maintain the scalar matrix form of the coefficients of $\gamma$ for simplicity.

For this model $Y_i = S_n \gamma_i$ with

$$S_n = \begin{bmatrix} I & 0 \\ \pi_1 & \mu_n/\sqrt{n} \end{bmatrix} \sqrt{n} = \begin{bmatrix} I & 0 \\ \pi_1 & I \end{bmatrix} \text{diag}(\sqrt{n}, ..., \sqrt{n}, \mu_n, ..., \mu_n).$$

This $S_n$ has the form given in Assumption 2 with

$$\tilde{S} = \begin{bmatrix} I & 0 \\ \pi_1 & I \end{bmatrix}, \mu_{jn} = \sqrt{n}, 1 \leq j \leq G_1, \mu_{jn} = \mu_n, G_1 + 1 \leq j \leq G.$$

This complicated form of $S_n$ is needed to accomodate fixed reduced form coefficients for included instruments and coefficients for excluded instruments that depend on $n$. We have been unable to simplify $S_n$ while maintaining the generality needed for these important cases.

In this example $\mu_n \rightarrow \infty$ must hold for Assumption 2 to be satisfied. This implies that $\delta^2$ is asymptotically identified. If $\mu_n$ were bounded we would be in a weak instrument setting similar to Staiger and Stock (1997), where $\delta^2$ is not asymptotically identified and limiting distributions of estimators are different than those given here.
The excluded instruments \( z_i^2 \) may be an unknown linear combination of the instrumental variables \( Z_i = (Z_{i1}', Z_{i2}')' \), so that \( z_i^2 \) can implicitly depend on \( n \). For example, we could have
\[
z_i^2 = \sum_{j=1}^{K_n-G_1} \pi_j^2 Z_{ij}^2 / \sqrt{K_n - G_1},
\]
where \( Z_{ij}^2 \) have variances that are bounded uniformly in \( K_n \) and \( 1/\sqrt{K_n - G_1} \) is included to normalize the variance of \( z_i^2 \) to be bounded. The many weak instrument example of Chao and Swanson (2005) is then included by taking \( \mu_n = \sqrt{K_n - G_1} \), in which case the reduced form for \( X_i^2 \) is
\[
\Upsilon_i^2 = \pi^1 Z_i^1 + \sum_{j=1}^{K_n-G_1} \pi_j^2 Z_{ij}^2 / \sqrt{n}.
\]

The excluded instrument \( z_i^2 \) may also be an unknown function that is being approximated by a linear combination of \( Z_i \). For instance, suppose that \( z_i^2 = f_0(w_i) \) for an unknown function \( f_0(w_i) \) of variables \( w_i \). In this case we could let the instrumental variables include a vector \( p_K(w_i) \overset{\text{def}}{=} (p_{1K}(w_i), ..., p_{K-G_1,K}(w_i))' \) of approximating functions, such as polynomials or splines. Here the vector of instrumental variables would be \( Z_i = (Z_{i1}', p_K(w_i))' \). For \( \mu_n = \sqrt{n} \) this example is like Newey (1990) where \( Z_i \) includes approximating functions for the reduced form but the number of instruments can grow as fast as the sample size. Alternatively, if \( \mu_n / \sqrt{n} \to 0 \), it is a modified version where \( \delta^2 \) is weakly identified.

In Assumption 2, \( \mu_n^2 \) can be interpreted as being proportional to the concentration parameter \( r_n \). For \( r_n = n \), we have asymptotic theory as in Kunitomo (1980), Morimune (1984), and Bekker (1994), where the number of instruments \( K_n \) can grow as fast as the sample size. For \( r_n \) growing slower than \( n \) we have the many weak instrument asymptotics of Chao and Swanson (2005).

The fundamental rate condition \( \sqrt{K_n}/r_n \to 0 \) given in Assumption 2 was explained earlier as being needed to ensure that the stochastic part of the objective function for the estimator does not dominate the identifying part.

**Assumption 3:** There is a constant, \( C \), such that conditional on \( Z = (Y, Z) \), the observations \( (\varepsilon_1, U_1), ..., (\varepsilon_n, U_n) \) are independent, with \( E[\varepsilon_i | Z] = 0 \), \( E[U_i | Z] = 0 \), \( \sup_i E[\varepsilon_i^2 | Z] < C \), and \( \sup_i E[\|U_i\|^2 | Z] \leq C \), almost surely.

This assumption requires second conditional moments of disturbances to be bounded; and also requires uniform nonsingularity of the variance of the reduced form disturbances.

**Assumption 4:** There is a \( \pi_{Kn} \) such that with probability one, \( \sum_{i=1}^n \| z_i - \pi_{Kn} Z_i \|^2 / n \to 0 \).
This condition allows an unknown reduced form that is approximated by a linear combination of the instrumental variables. The previous conditions are sufficient for consistency.

THEOREM 1: Suppose that Assumptions 1-4 are satisfied. Then, \( \mu_n^{-1} S'_n(\hat{\delta} - \delta_0) \xrightarrow{p} 0, \delta \xrightarrow{p} \delta_0, \mu_n^{-1} S'_n(\hat{\delta} - \delta_0) \xrightarrow{p} 0, \) and \( \hat{\delta} \xrightarrow{p} \delta_0. \)

The following additional condition is useful for establishing asymptotic normality and the consistency of the asymptotic variance.

Assumption 5: There is a constant, \( C > 0, \) such that with probability one, \( \sum_{i=1}^{n} ||z_i||^4/n^2 \longrightarrow 0, \) \( \sup_i E[\varepsilon_i^4|Z] < C, \) and \( \sup_i E[|U_i|^4|Z] \leq C. \)

To give asymptotic normality results, we need to describe the asymptotic variances. We will outline results that do not depend on convergence of various moment matrices; and so we will write the asymptotic variances as a function of \( n \) (rather than as a limit). Let \( \sigma_i^2 = E[\varepsilon_i^2|Z], \) where, for notational simplicity, we have suppressed the possible dependence of \( \sigma_i^2 \) on \( Z. \) Moreover, let

\[
\bar{H}_n = \sum_{i=1}^{n} z_i z_i'/n, \bar{\Omega}_n = \sum_{i=1}^{n} z_i z_i' \sigma_i^2 /n,
\]

\[
\bar{\Psi}_n = S_n^{-1} \sum_{i \neq j} P_{ij}^2 (E[U_i U_i'|Z] \sigma_j^2 (1 - P_{jj})^{-2} + E[U_i \varepsilon_i|Z](1 - P_{ii})^{-1} E[\varepsilon_j U_j'|Z](1 - P_{jj})^{-1}) S_n^{-1},
\]

\[
H_n = \sum_{i=1}^{n} (1 - P_{ii}) z_i z_i'/n, \Omega_n = \sum_{i=1}^{n} (1 - P_{ii})^2 z_i z_i' \sigma_i^2 /n,
\]

\[
\Psi_n = S_n^{-1} \sum_{i \neq j} P_{ij}^2 (E[U_i U_i'|Z] \sigma_j^2 + E[U_i \varepsilon_i|Z] E[\varepsilon_j U_j'|Z]) S_n^{-1}.
\]

When \( K/r_n \) is bounded, the conditional asymptotic variance given \( Z \) of \( S'_n(\hat{\delta} - \delta_0) \) is

\[
\bar{V}_n = \bar{H}_n^{-1}(\bar{\Omega}_n + \bar{\Psi}_n) \bar{H}_n^{-1},
\]

and the conditional asymptotic variance of \( S'_n(\hat{\delta} - \delta_0) \) is

\[
V_n = H_n^{-1}(\Omega_n + \Psi_n) H_n^{-1}.
\]

To state our asymptotic normality results, let \( A^{1/2} \) denote a square root matrix for a positive semi-definite matrix \( A, \) satisfying \( A^{1/2} A^{1/2'} = A. \) Also, for \( A \) nonsingular let \( A^{-1/2} = (A^{1/2})^{-1}. \)
Theorem 2: Suppose that Assumptions 1-5 are satisfied, $\sigma_i^2 \geq C > 0$ with probability one, and $K/r_n$ is bounded. Then, with probability one, $\bar{V}_n$ and $V_n$ are nonsingular for large enough $n$, and

$$\bar{V}_n^{-1/2} S_n' (\tilde{\delta} - \delta_0) \xrightarrow{d} N(0, I_G), V_n^{-1/2} S_n' (\hat{\delta} - \delta_0) \xrightarrow{d} N(0, I_G).$$

The convergence rate of the estimator is related to the size of $S_n$. In the simple case where $\delta$ is a scalar, we can take $S_n = \mu_n = \sqrt{r_n}$. In this case, the convergence rate of the estimator will simply be $1/\sqrt{r_n}$ when $K/r_n$ is bounded. This rate, the inverse square root of the rate of divergence of the concentration parameter, is the usual one for estimation using instrumental variables. This rate changes when $K$ grows faster than $r_n$.

The rate of convergence in Theorem 2 corresponds to the rate found by Stock and Yogo (2005b) for LIML, Fuller’s modified LIML, and B2SLS, when $r_n$ grows at the same rate as $K$ and slower than $n$, under homoskedasticity.

The term $\bar{\Psi}_n$ in the asymptotic variance of $\tilde{\delta}$, and the term $\Psi_n$ in the asymptotic variance of $\hat{\delta}$, account for the presence of many instruments. The order of these terms is $K/r_n$, so that if $K/r_n \rightarrow 0$, these terms can be dropped without affecting the asymptotic variance. When $K/r_n$ is bounded, but does not go to zero, these terms have the same order as other terms and it is important to account for their presence in standard errors. If $K/r_n \rightarrow \infty$, then these terms will dominate, and will slow down the convergence rate of the estimators. When $K/r_n \rightarrow \infty$, the conditional asymptotic variance given $Z$ of $\sqrt{r_n/K} S_n' (\tilde{\delta} - \delta_0)$ is

$$\bar{V}_n^* = H_n^{-1} (r_n/K) \bar{\Psi}_n H_n^{-1},$$

and the conditional asymptotic variance of $\sqrt{r_n/K} S_n' (\hat{\delta} - \delta_0)$ is

$$V_n^* = H_n^{-1} (r_n/K) \Psi_n H_n^{-1}.$$

When $K/r_n \rightarrow \infty$, the (conditional) asymptotic variance matrices, $\bar{V}_n^*$ and $V_n^*$, may be singular, especially when some components of $X_i$ are exogenous, or when different identification strengths are present. In order to allow for this singularity, our asymptotic normality results are stated in terms of a linear combination of the estimator. Let $L_n$ be a sequence of $\ell \times G$ matrices and let $\lambda_{\min}(A)$ denote the smallest eigenvalue of a symmetric matrix $A$. .
Theorem 3: Suppose that Assumptions 1-5 are satisfied and $K/r_n \to \infty$. If $L_n$ is bounded, and with probability one there is a $C > 0$ such that $\lambda_{\min} (L_n V_n^* L_n^t) \geq C$, then

$$(L_n V_n^* L_n^t)^{-1/2} L_n \sqrt{r_n/K} S_n^t (\hat{\delta} - \delta_0) \xrightarrow{d} N(0, I_\ell).$$

Also, if with probability one there is a $C > 0$ such that $\lambda_{\min} (L_n V_n^* L_n^t) \geq C$, then

$$(L_n V_n^* L_n^t)^{-1/2} L_n \sqrt{r_n/K} S_n^t (\hat{\delta} - \delta_0) \xrightarrow{d} N(0, I_\ell).$$

Here, the convergence rate is related to the size of $(\sqrt{r_n/K}) S_n$. In the simple case where $\delta$ is a scalar, we can take $S_n = \sqrt{r_n}$, giving a convergence rate of $\sqrt{K/r_n}$. In this case, the theorem states that $\left( r_n/\sqrt{K} \right) (\hat{\delta} - \delta_0)$ is asymptotically normal. It is interesting that $\sqrt{K/r_n} \to 0$ is a condition for consistency in this setting, as well as in the context of Theorem 1 above.

From Theorems 2 and 3, it is clear that the rates of convergence of both JIV estimators depend in general on the strength of the available instruments, as reflected in the relative orders of magnitude of $r_n$ vis-à-vis $K$. Note also that, whenever $r_n$ grows at a slower rate than $n$, the rate of convergence is slower than the conventional $\sqrt{n}$ rate of convergence, since in this case the available instruments are weaker than that assumed in the conventional strongly identified case, where the concentration parameter is taken to grow at the rate $n$.

When $P_{ii} = Z_i' (Z'Z)^{-1} Z_i$ goes to zero uniformly in $i$, the asymptotic variances of the two JIV estimators will get close in large samples. Since $\sum_{i=1}^n P_{ii} = tr(P) = K$, $P_{ii}$ going to zero will occur when $K$ grows more slowly than $n$, though precise conditions for this depend on the nature of $Z_i$. As a practical matter, $P_{ii}$ will generally be very close to zero in applications where $K$ is very small relative to $n$, making the jackknife estimators very close to each other.

Under homoskedasticity, we can compare the asymptotic variances of the two JIV estimators. With homoskedasticity the asymptotic variance of $\hat{\delta}$ is

$$\hat{V}_n = \hat{V}_n^1 + \hat{V}_n^2, \quad \hat{V}_n^1 = \sigma^2 \hat{H}_n^{-1}, \quad \hat{V}_n^2 = S_n^{-1} \sigma^2 E[U_i U_i' | Z] \sum_{i \neq j} P_{ij}^2 / (1 - P_{jj})^2 S_n^{-1}$$

$$+ S_n^{-1} E[U_i \epsilon_i | Z] E[U_i' \epsilon_i | Z] S_n^{-1} \sum_{i \neq j} P_{ij}^2 (1 - P_{ii})^{-1} (1 - P_{jj})^{-1}.$$
Also, the asymptotic variance of $\hat{\delta}$ is

\[
V_n = V_n^1 + V_n^2, \quad V_n^1 = \sigma^2 H_n^{-1} \left[ \sum_{i=1}^{n} (1 - P_{ii})^2 z_i z_i' / n \right] H_n^{-1},
\]

\[
V_n^2 = S_n^{-1} \left( \sigma^2 E[ U_i U_i' \mid Z] + E[ U_i \varepsilon_i \mid Z] E[ U_i' \varepsilon_i' \mid Z] \right) S_n^{-1} \sum_{i \neq j} P_{ij}.
\]

By the fact that $(1 - P_{ii})^{-1} > 1$, we have that $\bar{V}_n^2 \geq V_n^2$ in the positive semi-definite sense. Also, note that $V_n^1$ is the variance of an IV estimator with instruments $z_i(1 - P_{ii})$, while $\bar{V}_n^1$ is the variance of the corresponding least squares estimator, so that $\bar{V}_n^1 \leq V_n^1$. Thus, it appears that in general we cannot rank the asymptotic variances of the two estimators.

Next, we turn to results pertaining to the consistency of the asymptotic variance estimators, and to the use of these estimators in hypothesis testing. To proceed, first let $z_{ig}$ denote the $g^{th}$ element of $z_i$, and let $e_{i,n}$ be the $i^{th}$ column of an $n \times n$ identity matrix. Further, define $z_g = (z_{1g}, \ldots, z_{ng})'$. Also, define $\tilde{z}_{ig} = Z_{i}(Z'Z)^{-1}Z'z_{g} = \ell_{i,n}' P z_{g}$, so that $\tilde{z}_{ig}$ is the $i^{th}$ element of the projection of $z_{g}$ on the column space of $Z$. Finally, define $b_{g,n} = \min \left\{ \sqrt{n/\mu_{gn}}, \sqrt{n/K} \right\}$. We impose the following additional condition.

Assumption 6: There exists a positive constant $C$, and a positive integer $N$, such that for $g = 1, \ldots, G$;

\[
\sup_{n \geq N} E_{Z} \left[ \left( \frac{1}{b_{g,n}} \max_{1 \leq i \leq n} |z_{ig}| \right)^6 \right] \leq C, \quad \sup_{n \geq N} E_{Z} \left[ \left( \frac{1}{\sqrt{n}} \max_{1 \leq i \leq n} |\tilde{z}_{ig}| \right)^6 \right] \leq C.
\]

In addition, there exists a $\pi_n$ such that $\max_{i \leq n} \|z_i - \pi_n Z_i\| \longrightarrow 0$.

The next result shows that the estimators of the asymptotic variance we have given are consistent after normalization.

Theorem 4: Suppose that Assumptions 1-6 are satisfied. If $K/r_n$ is bounded, then $S_n' \bar{V} S_n - \bar{V}_n \overset{p}{\longrightarrow} 0$ and $S_n' \tilde{V} S_n - V_n \overset{p}{\longrightarrow} 0$. Also, if $K/r_n \longrightarrow \infty$, then $r_n S_n' \bar{V} S_n / K - \bar{V}_n^* \overset{p}{\longrightarrow} 0$ and $r_n S_n' \tilde{V} S_n / K - V_n^* \overset{p}{\longrightarrow} 0$.

A primary use of asymptotic variance estimators is in conducting approximate inference concerning coefficients.

Theorem 5: Suppose that Assumptions 1-6 are satisfied and that $a(\delta)$ is an $\ell \times 1$ vector of functions such that: i) $a(\delta)$ is continuously differentiable in a neighborhood of $\delta_0$; ii) there is a
square matrix, $B_n$, such that for $A = \partial a(\delta_0)/\partial \delta'$, $B_n A S_n^{-1} V_n S_n^{-1} A' B_n' S_n^{-1} 0$ is bounded; and iii) for any $\delta_k \xrightarrow{p} \delta_0$, ($k = 1, ..., \ell$) and $\bar{A} = [\partial a_1(\delta)/\partial \delta, ..., \partial a_\ell(\delta)/\partial \delta]'$, we have that $B_n(\bar{A} - A) S_n^{-1} \xrightarrow{p} 0$. If $K/r_n$ is bounded and $\lambda_{\min}(B_n A S_n^{-1} V_n S_n^{-1} A' B_n' S_n^{-1} 0) \geq C$, or if $K/r_n \xrightarrow{} \infty$ and $\lambda_{\min}(B_n A S_n^{-1} V_n S_n^{-1} A' B_n' S_n^{-1} 0) \geq C$, then for $\bar{A} = \partial a(\delta)/\partial \delta$,

$$(\bar{A} V \bar{A}')^{-1/2} \left[a(\bar{\delta}) - a(\delta_0)\right] \xrightarrow{d} N(0, I).$$

If $K/r_n$ is bounded and $\lambda_{\min}(B_n A S_n^{-1} V_n S_n^{-1} A' B_n' S_n^{-1} 0) \geq C$, or if $K/r_n \xrightarrow{} \infty$ and $\lambda_{\min}(B_n A S_n^{-1} V_n S_n^{-1} A' B_n' S_n^{-1} 0) \geq C$, then for $\hat{A} = \partial a(\delta)/\partial \delta$,

$$(\hat{A} V \hat{A}')^{-1/2} \left[a(\hat{\delta}) - a(\delta_0)\right] \xrightarrow{d} N(0, I).$$

Perhaps the most important special case of this result is the case of a single linear combination. This case will lead to t-statistics based on the consistent variance estimator having the usual standard normal limiting distribution. The following result considers such a case.

**COROLLARY 6:** Suppose that Assumptions 1-6 are satisfied, and that $c$ and $b_n$ are such that $b_n c' S_n^{-1} V_n S_n^{-1} A' B_n' S_n^{-1} 0$ is bounded. If $K/r_n$ is bounded and $b_n^2 c' S_n^{-1} V_n S_n^{-1} 0 c \geq C$, or if $K/r_n \xrightarrow{} \infty$ and $b_n^2 c' S_n^{-1} V_n S_n^{-1} 0 c \geq C$, then

$$\frac{c' (\hat{\delta} - \delta_0)}{\sqrt{c' V c}} \xrightarrow{d} N(0, 1).$$

Also, if $K/r_n$ is bounded and $c' S_n^{-1} V_n S_n^{-1} 0 c/b_n^2 \geq C$, or if $K/r_n \xrightarrow{} \infty$ and $c' S_n^{-1} V_n S_n^{-1} 0 c/b_n^2 \geq C$, then

$$\frac{c' (\hat{\delta} - \delta_0)}{\sqrt{c' V c}} \xrightarrow{d} N(0, 1).$$

4 **Concluding Remarks**

In this paper we have derived limiting distribution results for two alternative JIV estimators. These estimators are both seen to be consistent and asymptotically normal in the presence of many instruments, under heteroskedasticity of unknown form. In the same setup, LIIL, 2SLS, and B2SLS are inconsistent.
5 Appendix A - Proofs of Theorems

We will define a number of notation and abbreviations which will be used not only in this appendix but also in Appendix B. Let $C$ denote a generic positive constant that may be different in different uses and let $M$, $CS$, and $T$ denote the Markov inequality, the Cauchy-Schwartz inequality, and the Triangle inequality respectively. Also, for random variables $W_i$, $Y_i$, and $\eta_i$ and for $Z = (Y, Z)$, let $\bar{w}_i = E[W_i|Z]$, $\bar{W}_i = W_i - \bar{w}_i$, $\bar{y}_i = E[Y_i|Z]$, $\bar{Y}_i = Y_i - \bar{y}_i$, $\bar{\eta}_i = \eta_i - \bar{\eta}_i$, $\bar{y} = (\bar{y}_1, ..., \bar{y}_n)'$, $\bar{w} = (\bar{w}_1, ..., \bar{w}_n)'$,

$$\bar{\mu}_W = \max_{1 \leq i \leq n} |\bar{w}_i|, \bar{\mu}_Y = \max_{1 \leq i \leq n} |\bar{y}_i|, \bar{\mu}_\eta = \max_{1 \leq i \leq n} |\bar{\eta}_i|, \bar{\sigma}_W^2 = \max_{1 \leq i \leq n} Var[W_i|Z],$$

$$\bar{\sigma}_Y^2 = \max_{1 \leq i \leq n} Var[Y_i|Z], \bar{\sigma}_\eta^2 = \max_{1 \leq i \leq n} Var[\eta_i|Z];$$

where, in order to simplify notation, we have suppressed the dependence on $Z$ of the various quantities ($\bar{w}_i$, $\bar{W}_i$, $\bar{y}_i$, $\bar{Y}_i$, $\bar{\eta}_i$, $\bar{\mu}_W$, $\bar{\mu}_Y$, $\bar{\mu}_\eta$, $\bar{\sigma}_W^2$, $\bar{\sigma}_Y^2$, and $\bar{\sigma}_\eta^2$) defined above. Furthermore, for random variable $X$, define $\|X\|_{L_2,Z} = \sqrt{E[X^2|Z]}$.

We first give four lemmas that are useful in the proof of consistency, asymptotic normality, and consistency of the asymptotic variance estimator. We group them together here for ease of reference, because they are also used in Hausman et. al. (2007).

**Lemma A1**: If, conditional on $Z = (Y, Z)$, $(W_i, Y_i), (i = 1, ..., n)$ are independent with probability one and if $W_i$ and $Y_i$ are scalars, and $P$ is symmetric, idempotent of rank $K$ then for $\bar{w} = E[(W_1, ..., W_n)'|Z]$, $\bar{y} = E[(Y_1, ..., Y_n)'|Z]$, $\bar{\sigma}_{Wn} = \max_{i \leq n} Var(W_i|Z)^{1/2}$, $\bar{\sigma}_{Yn} = \max_{i \leq n} Var(Y_i|Z)^{1/2}$, there exists a positive constant $C$ such that

$$\left\| \sum_{i \neq j} P_{ij}W_iY_j - \sum_{i \neq j} P_{ij}\bar{w}_i\bar{y}_j \right\|^2_{L_2,Z} \leq CD_n \quad a.s. \quad P_Z$$

where $D_n = K\bar{\sigma}_{Wn}^2\bar{\sigma}_{Yn}^2 + \bar{\sigma}_{Wn}^2\bar{y}'\bar{y} + \bar{\sigma}_{Yn}^2\bar{\nu}'\bar{\nu}$.

**Proof**: Let $\tilde{w}_i = W_i - \bar{w}_i$ and $\tilde{y}_i = Y_i - \bar{y}_i$. Note that

$$\sum_{i \neq j} P_{ij}W_iY_j - \sum_{i \neq j} P_{ij}\bar{w}_i\bar{y}_j = \sum_{i \neq j} P_{ij}\tilde{w}_i\tilde{y}_j + \sum_{i \neq j} P_{ij}\bar{w}_i\bar{y}_j + \sum_{i \neq j} P_{ij}\tilde{w}_i\bar{y}_j.$$
Then by T we have

$$\sum_{i\neq j} P_{ij}^2 \leq 2D_{1n} \sum_{i\neq j} P_{ii}^2 \leq 2D_{1n} \sum_{i} P_{ii} = 2D_{1n} K.$$ 

Also, for \( \tilde{w} = (\tilde{w}_1, \ldots, \tilde{w}_n)' \), we have \(\sum_{i\neq j} P_{ij} \tilde{w}_i \tilde{y}_j = \tilde{w} P \tilde{y} - \sum_i P_{ii} \tilde{y}_i \tilde{w}_i\). By independence across \(i\) conditional on \(Z\), we have \(E[\tilde{w} \tilde{w}' | Z] \leq \sigma^2_{Wn} I_n\ a.s.\ P_Z\), so that

$$E[(\tilde{y}' P \tilde{w})^2 | Z] = \tilde{y}' P E[\tilde{w} \tilde{w}' | Z] P \tilde{y} \leq \sigma^2_{Wn} \tilde{y}' P \tilde{y} \leq \sigma^2_{Wn} \tilde{y}' \tilde{y},$$

$$E \left[ \left( \sum_i P_{ii} \tilde{y}_i \tilde{w}_i \right)^2 \right] \leq \sum_i P_{ii}^2 E[\tilde{w}_i^2 | Z] \tilde{y}_i^2 \leq \sigma^2_{Wn} \tilde{y}' \tilde{y}.$$ 

Then by T we have

$$\left\| \sum_{i \neq j} P_{ij} \tilde{w}_i \tilde{y}_j \right\|_{L^2, Z}^2 \leq \left\| \tilde{y}' P \tilde{w} \right\|_{L^2, Z}^2 + \left\| \sum_i P_{ii} \tilde{y}_i \tilde{w}_i \right\|_{L^2, Z}^2 \leq C \sigma^2_{Wn} \tilde{y}' \tilde{y} \ a.s. \ P_Z.$$ 

Intercalating the roles of \(Y_i\) and \(W_i\) gives

$$\left\| \sum_{i \neq j} P_{ij} \tilde{w}_i \tilde{y}_j \right\|_{L^2, Z}^2 \leq C \sigma^2_{Wn} \tilde{w}' \tilde{w} \ a.s. \ P_Z.$$ 

The conclusion then follows by T. Q.E.D.

**Lemma A2:** Suppose that conditional on \(Z\), the following conditions hold almost surely under the induced measure \(P_Z\): i) \(P\) is a symmetric, idempotent matrix with \(rank(P) = K, P_{ii} \leq C < 1\); ii) \((W_{1n}, U_{1n}, \varepsilon_1), \ldots, (W_{nn}, U_{nn}, \varepsilon_n)\) are independent and \(D_n = \sum_{i=1}^n E [W_{in} W_{in}' | Z]\) is bounded for \(n\) sufficiently large; iii) \(E[W_{in}' | Z] = 0, E[U_i | Z] = 0, E[\varepsilon_i | Z] = 0\) and there exists a constant \(C\) such that \(E[||U_i||^4 | Z] \leq C, E[\varepsilon_i^4 | Z] \leq C\); iv) \(\sum_{i=1}^n E \left[ ||W_{in}||^4 | Z \right] \rightarrow 0\). Suppose further that \(K \rightarrow \infty\) as \(n \rightarrow \infty\); then for \(\Sigma_n \defeq \sum_{i \neq j} P_{ij}^2 \left( E[U_i U_i' | Z] E[\varepsilon_j^2 | Z] + E[U_i \varepsilon_i | Z] E[\varepsilon_j U_j' | Z] \right) / K\) and any bounded sequences \(c_{1n}\) and \(c_{2n}\) of conformable vectors with \(\Xi_n = c_{1n} D_n c_{1n} + c_{2n} \Sigma_n c_{2n} > C\), it follows that

$$\sqrt{\sum_{i=1}^n c_{1n} W_{in} + c_{2n} \sum_{i \neq j} U_i P_{ij} \varepsilon_j / \sqrt{K}} \overset{d}{\rightarrow} N(0, 1).$$

Proof: The proof of Lemma A2 is long and is deferred to Appendix B.

The next two results are helpful in proving consistency of the variance estimator. They use the same notation as Lemma A1.
Lemma A3: If, conditional on \( Z \), \( (W_i, Y_i), (i = 1, \ldots, n) \) are independent, and if \( W_i \) and \( Y_i \) are scalars; then there exists a positive constant \( C \) such that

\[
\left\| \sum_{i \neq j} P_{ij}^2 W_i Y_j - E \left[ \sum_{i \neq j} P_{ij}^2 W_i Y_j | Z \right] \right\|_{L_2, Z}^2 \leq C B_n \quad \text{a.s.} \ \mathbb{P}_Z
\]

where \( B_n = K \left\{ \sigma^2_W \sigma_Y^2 + \sigma^2_W \hat{\mu}_Y^2 + \hat{\mu}_W \sigma_Y^2 \right\} \).

Proof: Using the notation of the proof of Lemma A1, we have

\[
\sum_{i \neq j} P_{ij}^2 W_i Y_j = \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j = \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j + \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j + \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j.
\]

As before, for \( i \neq j \) and \( k \neq \ell \), \( E [\tilde{w}_i \tilde{y}_j \tilde{w}_k \tilde{y}_\ell | Z] \) is zero unless \( i = k \) and \( j = \ell \) or \( i = \ell \) and \( j = k \). Then by CS, \( P_{ij}^4 \leq P_{ij}^2 \), and \( \sum_j P_{ij} = P_{ii} \),

\[
E \left( \left( \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j \right)^2 \right) \leq 2 \sigma_W^2 \sigma_Y^2 \sum_{i \neq j} P_{ij}^4 \leq 2 K \sigma_W^2 \sigma_Y^2 \quad \text{a.s.} \ \mathbb{P}_Z.
\]

Also, \( \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j = \tilde{w}' \tilde{P} \tilde{y} = \sum_i P_{ii}^2 \tilde{y}_i \tilde{w}_i \) where \( \tilde{P}_{ij} = P_{ij}^2 \). By independence across \( i \) conditional on \( Z \), we have \( E[\tilde{w} \tilde{w}' | Z] \leq \sigma_W^2 I_n \), so that

\[
E[\tilde{y}' \tilde{P} \tilde{y}] = \tilde{y}' \tilde{P} E[\tilde{w} \tilde{w}'] \tilde{P} \tilde{y} \leq \sigma_W^2 \tilde{y}' \tilde{P} \tilde{y} \leq \sigma_W^2 \sum_{i,j,k} \tilde{y}_i P_{ik}^2 P_{kj}^2 \tilde{y}_j
\]

\[
\leq \sigma_W^2 \tilde{y}' \tilde{P} \tilde{y} \leq \sigma_W^2 \sigma_Y^2 \sum_{i,j,k} \tilde{y}_i P_{ik}^2 P_{kj}^2 \leq K \sigma_W^2 \mu_Y^2 \quad \text{a.s.} \ \mathbb{P}_Z.
\]

Then by T we have

\[
\left\| \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j \right\|_{L_2, Z}^2 \leq \left\| \tilde{w}' \tilde{P} \tilde{y} \right\|_{L_2, Z}^2 + \left\| \sum_i P_{ii}^2 \tilde{y}_i \tilde{w}_i \right\|_{L_2, Z}^2 \leq C K \sigma_W^2 \sigma_Y^2 \quad \text{a.s.} \ \mathbb{P}_Z.
\]

Interchanging the roles of \( Y_i \) and \( W_i \) gives \( \left\| \sum_{i \neq j} P_{ij}^2 \tilde{w}_i \tilde{y}_j \right\|_{L_2, Z}^2 = C K \mu_W^2 \sigma_Y^2 \quad \text{a.s.} \ \mathbb{P}_Z \). The conclusion then follows by T. Q.E.D.
As a notational convention we let $\sum_{i\neq j \neq k}$ denote $\sum_{i} \sum_{j \neq i} \sum_{k \neq \{i, j\}}$.

**Lemma A4**: Suppose that conditional on $\mathcal{Z}$; $(W_1, Y_1, \eta_1), \ldots, (W_n, Y_n, \eta_n)$ are independent, and suppose that $KEZ \left[ \overline{\sigma}_W^2 \mu_W \overline{\mu}_W^2 \right] \rightarrow 0$ as $n \rightarrow \infty$ and there exists a positive constant $C$ such that, for $n$ sufficiently large, $E_Z [\overline{\sigma}_W^2] \leq C, KEZ [\overline{\mu}_W^2] \leq C, KEZ [\overline{\mu}_W^4] \leq C$. Suppose further that with probability one for $n$ large enough, $\sum_i \bar{w}_i \leq C$, $\sum_j \bar{y}_j \leq C, Var(W_i | \mathcal{Z}) \leq C/r_n$, and $Var(Y_i | \mathcal{Z}) \leq C/r_n$ and that there exists $\pi_n$ such that $\max_{i \leq n} |a_i - Z_i \pi_n| \rightarrow 0$ a.s. $P_{\mathcal{Z}}$, and $\sqrt{K}/r_n \rightarrow 0$; then

$$A_n = E \left[ \sum_{i \neq j \neq k} W_i P_{ik} \eta_k P_{kj} Y_j | \mathcal{Z} \right] = O_p(1), \quad \sum_{i \neq j \neq k} W_i P_{ik} \eta_k P_{kj} Y_j - A_n \overset{p}{\rightarrow} 0.$$

**Proof**: Given in Appendix B.

**Lemma A5**: If Assumptions 1-3 are satisfied; then,

$$S_n^{-1} \bar{H} S_n^{-1} \epsilon = \sum_{i \neq j} z_i P_{ij} (1 - P_{jj})^{-1} \epsilon_j/n + o_p(1), S_n^{-1} \sum_{i \neq j} X_i P_{ij} (1 - P_{jj})^{-1} \epsilon_j/\mu_n \overset{p}{\rightarrow} 0,$$

$$S_n^{-1} \bar{H} S_n^{-1} \epsilon = \sum_{i \neq j} z_i P_{ij} z_j/n + o_p(1), S_n^{-1} \sum_{i \neq j} X_i P_{ij} \epsilon_j/\mu_n \overset{p}{\rightarrow} 0.$$

**Proof**: Apply Lemma A1 with $Y_i = e'_k S_n^{-1} X_i = z_i/k \sqrt{n} + e'_k S_n^{-1} U_i$ and $W_i = e'_\ell S_n^{-1} X_i (1 - P_{ii})^{-1}$ for some $k$ and $\ell$. Note that since $\|S_n^{-1}\| \leq C/\sqrt{n}$,

$$E[|Y_i| | \mathcal{Z}] = z_i/k \sqrt{n}, Var(Y_i | \mathcal{Z}) \leq C/r_n \ a.s. \mathbb{P}_\mathcal{Z}, E[W_i | \mathcal{Z}] = z_i/\sqrt{n}(1 - P_{ii}),$$

$$Var(W_i | \mathcal{Z}) \leq C/r_n \ a.s. \mathbb{P}_\mathcal{Z}.$$

Note that with probability one

$$\sqrt{K} \sigma_{W_n} \sigma_{Y_n} \leq C \sqrt{K}/r_n \rightarrow 0,$$

$$\sigma_{W_n} \sqrt{\overline{y}^\prime \overline{y}} \leq C r_n^{-1/2} \sqrt{\sum_i z_i^2/k/n} \rightarrow 0,$$

$$\sigma_{Y_n} \sqrt{\overline{w}^\prime \overline{w}} \leq C r_n^{-1/2} \sqrt{\sum_i z_i^2/n} \leq C r_n^{-1/2} \sqrt{\sum_i z_i^2/n} \rightarrow 0.$$

Since $e'_k S_n^{-1} \bar{H} S_n^{-1} \epsilon \ell = e'_k S_n^{-1} \sum_{i \neq j} X_i P_{ij} X_j S_n^{-1} \epsilon_j/(1 - P_{jj}) = \sum_{i \neq j} W_i P_{ij} Y_j$ and $P_{ij} \overline{w}_i \overline{y}_j = P_{ij} z_i z_j/n (1 - P_{jj})$, applying Lemma A1 and the conditional version of $M$, we deduce that for any $v > 0$

$$P \left( \left| e'_k S_n^{-1} \bar{H} S_n^{-1} \epsilon \ell - \sum_{i \neq j} e'_k z_i P_{ij} (1 - P_{jj})^{-1} z_j e_\ell/n \right| \geq v \mid \mathcal{Z} \right) \rightarrow 0 \ \ a.s. \mathbb{P}_\mathcal{Z}.$$

Moreover, note that, clearly, for some $\epsilon > 0$

$$\sup_n E \left[ \left( C \left( \sum_{i \neq j} \left| e'_k z_i P_{ij} (1 - P_{jj})^{-1} z_j e_\ell/n \right| \geq v \mid \mathcal{Z} \right) \right)^{1+\epsilon} \right] < \infty,$$

18
(take, for example, \( \epsilon = 1 \)). Hence, by a version of the dominated convergence theorem, as given by Theorem 25.12 of Billingsley (1986), it follows that as \( n \to \infty \),

\[
P \left( \sum_{i \neq j} \epsilon_i' z_i P_{ij} (1 - P_{jj})^{-1} z_j' \epsilon_j / n \geq v \right) = \mathbb{E} \left[ P \left( \sum_{i \neq j} \epsilon_i' z_i P_{ij} (1 - P_{jj})^{-1} z_j' \epsilon_j / n \geq v \mid \mathcal{Z} \right) \right] \to 0.
\]

The above argument establishes the first conclusion for the \((k, \ell)\) element. Now, doing this for every element completes the proof for the first conclusion.

For the second conclusion, apply Lemma A1 with \( Y_i = \epsilon_k' S_n^{-1} X_i \) as before and \( W_i = \varepsilon_i / \sqrt{n} (1 - P_{ii}) \) and follow the same argument as that used to establish the first conclusion above.

For the third conclusion, apply Lemma A1 with \( W_i = \epsilon_k' S_n^{-1} X_i \) as before and \( Y_i = \epsilon_j' S_n^{-1} X_i \), so that with probability one

\[
\sqrt{K} \bar{\sigma}_{W_n} \bar{\sigma}_{Y_n} \leq C \sqrt{K} \tau_n \to 0, \quad \bar{\sigma}_{W_n} \sqrt{y^T y} \leq C r_n^{-1/2} \sqrt{\sum z_{ik}^2 / n} \to 0,
\]

\[
\bar{\sigma}_{Y_n} \sqrt{w^T w} \to 0.
\]

The fourth conclusion follows similarly. Q.E.D.

Let \( \bar{H}_n = \sum_i z_i z_i' / n \) and \( H_n = \sum_i (1 - P_{ii}) z_i z_i' / n \).

**Lemma A6:** If Assumptions 1-4 are satisfied; then,

\[
S_n^{-1} \bar{H} S_n^{-1} = H_n + o_p(1), S_n^{-1} H S_n^{-1} = H_n + o_p(1).
\]

**Proof:** Let \( \bar{z}_i = \sum_{j=1}^n P_{ij} z_j \) be the \( i^{th} \) element of \( P \bar{z} \) and note that

\[
\sum_{i=1}^n \left\| z_i - \bar{z}_i \right\|^2 / n = \left\| (I - P) z \right\|^2 / n = tr[(z' (I - P) z) / n] = tr[(z - Z \pi'_K) (I - P)(z - Z \pi'_K) / n]
\]

\[
\leq \left[ tr[(z - Z \pi'_K)(z - Z \pi'_K) / n] \right] = \sum_{i=1}^n \left\| z_i - \pi_K Z_i \right\|^2 / n \to 0 \text{ a.s. } \mathbb{P}_\mathcal{Z}.
\]

It follows that with probability one

\[
\left\| \sum_i (\bar{z}_i - z_i)(1 - P_{ii})^{-1} z_i' / n \right\| \leq \sum_i \left\| \bar{z}_i - z_i \right\| \left\| (1 - P_{ii})^{-1} z_i' \right\| / n
\]

\[
\leq \sqrt{\sum_i \left\| \bar{z}_i - z_i \right\|^2 / n} \sqrt{\sum_i \left\| (1 - P_{ii})^{-1} z_i \right\|^2 / n} \to 0.
\]
Then
\[
\sum_{i \neq j} z_i P_{ij}(1 - P_{jj})^{-1} z'_j/n = \sum_{i,j} z_i P_{ij}(1 - P_{jj})^{-1} z'_j/n - \sum_i z_i P_{ii}(1 - P_{ii})^{-1} z'_j/n
\]
\[
= \sum_i \bar{z}_i(1 - P_{ii})^{-1} z'_j/n - \sum_i z_i P_{ii}(1 - P_{ii})^{-1} z'_j/n
\]
\[
= \bar{H}_n + \sum_i (\bar{z}_i - z_i)(1 - P_{ii})^{-1} z'_j/n = \bar{H}_n + o_{a.s}(1).
\]

The first conclusion then follows from Lemma A5 and the triangle inequality. Also, as in the last equation we have
\[
\sum_{i \neq j} z_i P_{ij}z'_j/n = \sum_{i,j} z_i P_{ij}z'_j/n - \sum_i P_{ii}z_i z'_i/n = \sum_i \bar{z}_i z'_i/n - \sum_i P_{ii}z_i z'_i/n
\]
\[
= H_n + \sum_i (\bar{z}_i - z_i)z'_i/n = H_n + o_{a.s}(1),
\]
so the second conclusion follows similarly to the first. Q.E.D.

Proof of Theorem 1: First, note that by \(\lambda_{\min}(S_n S_n' / r_n) \geq \lambda_{\min}(\tilde{S} \tilde{S}') \geq C\) we have
\[
\left\| S_n' (\tilde{\delta} - \delta_0) / \mu_n \right\| \geq \lambda_{\min}(S_n S_n' / r_n)^{1/2} \| \tilde{\delta} - \delta_0 \| \geq C \| \tilde{\delta} - \delta_0 \| .
\]
Therefore, \(S_n' (\tilde{\delta} - \delta_0) / \mu_n \xrightarrow{p} 0\) will imply \(\tilde{\delta} \xrightarrow{p} \delta_0\). Note that by Assumption 2, \(\bar{H}_n\) is bounded and \(\lambda_{\min}(\bar{H}_n) \geq C\) for large enough \(n\), with probability one. For \(\bar{H}\) from Section 2, it follows from Lemma A6 and Assumption 2 that with probability approaching one \(\lambda_{\min}(S_n^{-1} \bar{H} S_n^{-1'}) \geq C\) as the sample size grows. Hence \((S_n^{-1} \bar{H} S_n^{-1'})^{-1} = O_p(1)\). By eq. (1),
\[
\mu_n^{-1} S_n' (\tilde{\delta} - \delta_0) = (S_n^{-1} \bar{H} S_n^{-1'})^{-1} S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j / \mu_n = O_p(1) o_p(1) \xrightarrow{p} 0.
\]

All of the previous statements are conditional on \(Z = (\Upsilon, Z)\) for a given sample size \(n\), so that for the random variable \(R_n = \mu_n^{-1} S_n' (\tilde{\delta} - \delta_0)\) we have shown that for any constant \(v > 0\), with probability one
\[
\Pr(\|R_n\| \geq v | \Upsilon, Z) \longrightarrow 0.
\]

Then by the dominated convergence theorem,
\[
\Pr(\|R_n\| \geq v) = E[\Pr(\|R_n\| \geq v | \Upsilon, Z)] \longrightarrow 0.
\]
Therefore, since \(v\) is arbitrary, it follows that \(R_n = \mu_n^{-1} S_n' (\tilde{\delta} - \delta_0) \xrightarrow{p} 0\).
Next note that \( P_{ii} \leq C < 1 \), so in the positive semi-definite sense in large enough samples with probability one,

\[
H_n = \sum (1 - P_{ii}) z_i' z_i / n \geq (1 - C) \bar{H}_n,
\]

Thus, \( H_n \) is bounded and bounded away from singularity for large enough \( n \) with probability one. Then the rest of the conclusion follow analogously with \( \hat{\delta} \) replacing \( \hat{\delta} \) and \( H_n \) replacing \( \bar{H}_n \). Q.E.D.

We now turn to the asymptotic normality results. In what follows let \( \xi_i = \hat{\varepsilon}_i \) when considering the JIV2 estimator and let \( \xi_i = \varepsilon_i / (1 - P_{ii}) \) when considering JIV1.

**Proof of Theorem 2:** Note that \( E\left[ \xi_i^2 \mid Z \right] \leq C \) a.s. \( P_Z \), so that

\[
E \left[ \left| \sum_{i=1}^{n} (z_i - \bar{z}_i) \xi_i / \sqrt{n} \right|^2 \mid Z \right] = \sum_{i=1}^{n} \|z_i - \bar{z}_i\|^2 E \left[ \xi_i^2 \mid Z \right] / n \leq C \sum_{i=1}^{n} \|z_i - \bar{z}_i\|^2 / n \to 0 \text{ a.s. } P_Z.
\]

Note further that

\[
S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j - \sum_{i} z_i (1 - P_{ii}) \xi_i / \sqrt{n} - S_n^{-1} \sum_{i \neq j} U_i P_{ij} \xi_j = \sum_{i=1}^{n} (z_i - \bar{z}_i) \xi_i / \sqrt{n},
\]

so that by a conditional version of M, we deduce that for any \( v > 0 \)

\[
P \left( \left| \sum_{i=1}^{n} (z_i - \bar{z}_i) \xi_i / \sqrt{n} \right| \geq v \mid Z \right) \to 0 \text{ a.s. } P_Z.
\]

Moreover, note that there exists \( \epsilon > 0 \) such that

\[
\sup_{n} E \left[ \left| P \left( \left| \sum_{i=1}^{n} (z_i - \bar{z}_i) \xi_i / \sqrt{n} \right| \geq v \mid Z \right) \right|^{1+\epsilon} \right] < \infty,
\]

(take, for example, \( \epsilon = 1 \)). Hence, by a version of the dominated convergence theorem, as given by Theorem 25.12 of Billingsley (1986), it follows that as \( n \to \infty \),

\[
S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j - \sum_{i} z_i (1 - P_{ii}) \xi_i / \sqrt{n} - S_n^{-1} \sum_{i \neq j} U_i P_{ij} \xi_j = \sum_{i=1}^{n} (z_i - \bar{z}_i) \xi_i / \sqrt{n} \overset{P}{\to} 0.
\]

Let \( W_{in} = z_i (1 - P_{ii}) \xi_i / \sqrt{n} \) and

\[
\Gamma_n = Var \left( \sum_{i=1}^{n} W_{in} + \sum_{i \neq j} S_n^{-1} U_i P_{ij} \xi_j \mid Z \right) = \sum_{i=1}^{n} z_i' z_i (1 - P_{ii})^2 E[\xi_i^2 \mid Z] / n + S_n^{-1} \sum_{i \neq j} P_{ij}^2 \left( E[U_i U_i' \mid Z] E[\xi_i^2 \mid Z] + E[U_i \xi_i \mid Z] E[U_j \xi_j \mid Z] \right) S_n^{-1}.
\]
Note that \( \mu_n S_n^{-1} \) is bounded by Assumption 2 and that \( \sum_{i \neq j} P_{ij}^2 / K \leq 1 \), so by the almost sure boundedness of \( \sum_i z_i z_i' / n \), Assumption 3, and the boundedness of \( K / \mu_n^2 \), it follows that \( \Gamma_n \) is bounded with probability one for \( n \) sufficiently large. Also, \( E[\xi_i^2 | \mathcal{Z}] \geq C > 0 \), so that

\[
\Gamma_n \geq \sum_{i=1}^{n} z_i z_i' (1 - P_{ii})^2 E[\xi_i^2] / n \geq C \sum_{i=1}^{n} z_i z_i' / n,
\]

so by Assumption 2 \( \lambda_{\min}(\Gamma_n) \geq C > 0 \) with probability one for all \( n \) large enough. It follows that \( \Gamma_n^{-1} \) exists and is bounded in \( n \) with probability one for \( n \) large enough.

Let \( \alpha \) be a \( G \times 1 \) nonzero vector. Now apply Lemma A2 with \( U_i \) there equal to \( U_i \) here, \( \varepsilon_i \) there equal to \( \xi_i \) here, \( W_{in} = z_i (1 - P_{ii}) \xi_i / \sqrt{n} \), \( c_{1n} = \Gamma_n^{-1/2} \alpha \), and \( c_{2n} = \sqrt{K} S_n^{-1} \Gamma_n^{-1/2} \). Note that condition i) of Lemma A2 is satisfied. Also, by the boundedness of \( \sum_i z_i z_i' / n \) and \( E[\xi_i^2 | \mathcal{Z}] \) with probability one, condition ii) of Lemma A2 is satisfied and condition iii) is satisfied by Assumptions 3 and 5. Also, by \( (1 - P_{ii})^{-1} \leq C \) and Assumption 5,

\[
\sum_{i=1}^{n} E \left[ \|W_{in}\|^4 | \mathcal{Z} \right] \leq C \sum_{i=1}^{n} \|z_i\|^4 / n^2 \rightarrow 0 \quad a.s. \, \mathbb{P}_\mathcal{Z}.
\]

so condition iv) is satisfied. Finally, condition v) is satisfied by hypothesis. Note also that with probability one \( c_{1n} = \Gamma_n^{-1/2} \alpha \) and \( c_{2n} = \left( \sqrt{K} / \mu_n \right) \mu_n S_n^{-1} \Gamma_n^{-1/2} \) are bounded by the boundedness of \( \sqrt{K} / \mu_n \), \( \mu_n S_n^{-1} \), and \( \Gamma_n^{-1} \). Moreover, \( \Xi_n = \alpha' \alpha \) by construction and, thus, \( \Xi_n \) is also bounded and \( \Xi_n \geq C > 0 \). Then by the conclusion of Lemma A2,

\[
(\alpha' \alpha)^{-1/2} \alpha' \Gamma_n^{-1/2} S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j = (\alpha' \alpha)^{-1/2} \alpha' \Gamma_n^{-1/2} \left( \sum_{i=1}^{n} W_{in} + \sum_{i \neq j} S_n^{-1} U_i P_{ij} \xi_j + o_p(1) \right)
\]

\[
= \Xi_n^{-1/2} \left( \sum_{i=1}^{n} c_{1n} W_{in} + c_{2n} \sum_{i \neq j} U_i P_{ij} \xi_j / \sqrt{K} \right) \xrightarrow{d} N(0, 1).
\]

It follows that \( \alpha' \Gamma_n^{-1/2} S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j \xrightarrow{d} N(0, \alpha' \alpha) \), so by the Cramer-Wold device,

\[
\Gamma_n^{-1/2} S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j \xrightarrow{d} N(0, I_G).
\]

Consider now the JIV1 estimator, where \( \xi_i = \varepsilon_i / (1 - P_{ii}) \) and \( \Gamma_n = \bar{\Omega}_n + \bar{\Psi}_n \), so that

\[
(\bar{\Omega}_n + \bar{\Psi}_n)^{-1/2} S_n^{-1} \sum_{i \neq j} X_i P_{ij} (1 - P_{jj})^{-1} \xi_j \xrightarrow{d} N(0, I_G).
\]

Note that \( B_n = \bar{V}_n^{-1/2} \bar{H}_n^{-1} \Gamma_n^{1/2} \) is an orthogonal matrix, since \( B_n B_n' = \bar{V}_n^{-1/2} \bar{V}_n \bar{V}_n^{-1/2} = I \). Also, \( \bar{V}_n^{-1/2} \) is bounded by \( \lambda_{\min}(\bar{V}_n) \geq C > 0 \), and \( \Gamma_n^{1/2} \) is also bounded by \( \Gamma_n \) bounded. By Lemma A6,
\( (S_n^{-1} \tilde{H}_n S_n^{-1'})^{-1} = \tilde{H}_n^{-1} + o_p(1) \). Therefore, we have
\[
\tilde{V}_n^{-1/2} (S_n^{-1} \tilde{H}_n S_n^{-1'})^{-1} \Gamma_n^{1/2} = \tilde{V}_n^{-1/2} (\tilde{H}_n^{-1} + o_p(1)) \Gamma_n^{1/2} = B_n + o_p(1).
\]

Note also that if \( Y_n \xrightarrow{d} N(0, I_G) \) then for any orthogonal matrix \( B_n \), \( B_n Y_n \xrightarrow{d} N(0, I_G) \). Then by the Slutsky lemma and \( \tilde{\alpha} = \delta_0 + \tilde{H}^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j \) for \( \xi_j = (1 - P_{jj})^{-1} \varepsilon_j \) we have
\[
\tilde{V}_n^{-1/2} S_n' (\tilde{\alpha} - \delta_0) = \tilde{V}_n^{-1/2} S_n' \tilde{H}^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j = \tilde{V}_n^{-1/2} (S_n^{-1} \tilde{H}^{-1} S_n^{-1'})^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j
\]
\[
= \tilde{V}_n^{-1/2} (S_n^{-1} \tilde{H}^{-1} S_n^{-1'})^{-1} \Gamma_n^{1/2} \Gamma_n^{-1/2} \sum_{i \neq j} X_i P_{ij} \xi_j
\]
\[
= B_n + o_p(1) \frac{d}{d} N(0, I_G).
\]

The conclusion for JIV2 follows by a similar argument for \( \xi_i = \varepsilon_i \). Q.E.D.

**Proof of Theorem 3:** Under the hypotheses of Theorem 3, \( r_n/K \xrightarrow{a.s.} 0 \). Similarly to the proof of Theorem 2 we have,
\[
\sqrt{r_n/K} S_n^{-1} \sum_{i \neq j} X_i P_{ij} \xi_j = \sqrt{r_n/K} \sum_{i=1}^n z_i (1 - P_{ii}) \xi_i / \sqrt{n} + \mu_n S_n^{-1} \sum_{i \neq j} U_i P_{ij} \xi_j / \sqrt{K} + o_p(1)
\]
\[
= \mu_n S_n^{-1} \sum_{i \neq j} U_i P_{ij} \xi_j / \sqrt{K} + o_p(1).
\]

Here let
\[
\Gamma_n = Var \left( \mu_n S_n^{-1} \sum_{i \neq j} U_i P_{ij} \xi_j / \sqrt{K} \bigg| Z \right)
\]
\[
= \mu_n^2 S_n^{-1} \sum_{i \neq j} P_{ij}^2 \left( E[U_i U'_j | Z] E[\xi_j^2 | Z] + E[U_i \xi_i | Z] E[U'_j \xi_j | Z] \right) S_n^{-1} / K.
\]

Note that with probability one, \( \Gamma_n \) is bounded given that \( \mu_n S_n^{-1} \) is bounded, \( E[||U_i||^2 | Z] \leq C \), and \( E[\xi_j^2 | Z] \leq C \) a.s. \( P_Z \). Let \( \tilde{L}_n \) be any sequence of bounded matrices with \( \lambda_{\min}(\tilde{L}_n \Gamma_n \tilde{L}_n') \geq C \) and let
\[
\tilde{Y}_n = \left( \tilde{L}_n \Gamma_n \tilde{L}_n' \right)^{-1/2} \tilde{L}_n \sqrt{r_n/K} S_n^{-1} \sum_{i \neq j} U_i P_{ij} \xi_j.
\]

Now let \( \alpha \) be a nonzero vector and apply Lemma A2 with \( W_{in} = 0, \varepsilon_i = \xi_i, c_{1n} = 0, \) and \( c_{2n} = \alpha' (\tilde{L}_n \Gamma_n \tilde{L}_n'^{-1/2} \tilde{L}_n \mu_n S_n^{-1} - 1). \) We have \( c_{2n}^2 Var \left( \sum_{i \neq j} U_i P_{ij} \xi_j / \sqrt{K} \right) c_{2n} = \alpha' \alpha > 0 \) by construction. Then by the conclusion of Lemma A2 it follows that \( \alpha' \tilde{Y}_n \xrightarrow{d} N(0, \alpha' \alpha) \). Then by the Cramer-Wold device we have
\[
\tilde{Y}_n \xrightarrow{d} N(0, I).
\]
Consider now the JIV1 estimator, where $\xi_i = \varepsilon_i/(1 - P_{ii})$ and $\Gamma_n = (r_n/K)\bar{\Psi}_n$, so that
\[
(L_n\Gamma_nL_n')^{-1/2} L_n\sqrt{r_n/K}S_n^{-1}\sum_{i\neq j} X_iP_{ij}(1 - P_{jj})^{-1}\varepsilon_j = \bar{Y}_n + O_p(1) \overset{d}{\longrightarrow} N(0, I_{\ell}).
\]
Let $L_n$ be as specified in the statement of the result such that $\lambda_{\min}(L_n\bar{V}_nL_n') \geq C > 0$ with probability one and let $\tilde{L}_n = L_n\bar{H}^{-1}_n$, so that $L_n\bar{V}_nL_n' = \tilde{L}_n\Gamma_nL_n'$. Note that, $(L_n\Gamma_nL_n')^{-1/2}$ and $\Gamma_n^{1/2}$ are bounded with probability one. By Lemma A6, $(S_n^{-1}\bar{H}S_n^{-1})^{-1} = \bar{H}^{-1} + O_p(1)$. Therefore, we have
\[
(L_n\Gamma_nL_n')^{-1/2} L_n(S_n^{-1}\bar{H}S_n^{-1})^{-1} = (L_n\Gamma_nL_n')^{-1/2} L_n(\bar{H}^{-1} + O_p(1)) = (L_n\Gamma_nL_n')^{-1/2} \tilde{L}_n + O_p(1),
\]
Note also that $\sqrt{r_n/K}S_n^{-1}\sum_{i\neq j} X_iP_{ij}(1 - P_{jj})^{-1}\varepsilon_j = O_p(1)$. Then we have
\[
(L_n\bar{H}^{-1}_n\bar{\Psi}_n\bar{H}^{-1}_nL_n')^{-1/2} L_nS_n'(\bar{\delta} - \delta_0)
= (\tilde{L}_n\Gamma_n\tilde{L}_n')^{-1/2} L_n(S_n^{-1}\bar{H}^{-1}_nS_n^{-1})\sqrt{r_n/K}S_n^{-1}\sum_{i\neq j} X_iP_{ij}(1 - P_{jj})^{-1}\varepsilon_j
= \left[(\tilde{L}_n\Gamma_n\tilde{L}_n')^{-1/2} \tilde{L}_n + O_p(1)\right] \sqrt{r_n/K}S_n^{-1}\sum_{i\neq j} X_iP_{ij}(1 - P_{jj})^{-1}\varepsilon_j + O_p(1)
= \bar{Y}_n + O_p(1) \overset{d}{\longrightarrow} N(0, I_{\ell}).
\]
The conclusion for JIV2 follows by a similar argument for $\xi_i = \varepsilon_i$. Q.E.D.

Next, we turn to the proof of Theorem 4. Let $\tilde{\xi}_i = (y_i - X_i\tilde{\delta})/(1 - P_{ii})$ and $\xi_i = \varepsilon_i/(1 - P_{ii})$ for JIV1 and $\tilde{\xi}_i = y_i - X_i\tilde{\delta}$ and $\xi_i = \varepsilon_i$ for JIV2. Also, let
\[
\begin{align*}
\dot{X}_i &= S_n^{-1}X_i, \dot{\Sigma}_1 = \sum_{i\neq j\neq k} \dot{X}_iP_{ik}\xi_k^{\tilde{P}}P_{kj}\dot{X}_j, \dot{\Sigma}_2 = \sum_{i\neq j} P_{ij}^2 \left(\dot{X}_i\dot{X}_j\xi_j + \dot{X}_i\xi_j\dot{X}_j\right), \\
\ddot{\Sigma}_1 &= \sum_{i\neq j\neq k} \dot{X}_iP_{ik}\xi_k^2P_{kj}\dot{X}_j, \ddot{\Sigma}_2 = \sum_{i\neq j} P_{ij}^2 \left(\dot{X}_i\dot{X}_j\xi_j^2 + \dot{X}_i\xi_j\dot{X}_j\right).
\end{align*}
\]

**Lemma A7:** If Assumptions 1-6 are satisfied then $\dot{\Sigma}_1 - \ddot{\Sigma}_1 = O_p(1)$ and $\ddot{\Sigma}_2 - \dot{\Sigma}_2 = O_p(K/r_n)$.

**Proof:** To show the first conclusion, we need to verify the conditions of Lemma A4. To proceed, note first that for $\dot{\delta} = \tilde{\delta}$ and $X_i^P = X_i/(1 - P_{ii})$ for JIV1 and $\dot{\delta} = \tilde{\delta}$ and $X_i^P = X_i$ for JIV2, $\dot{\delta} \overset{P}{\longrightarrow} \delta_0$ and
\[
\dot{\xi}_i^2 - \xi_i^2 = -2\xi_iX_i^P(\dot{\delta} - \delta_0) + \left[X_i^P(\dot{\delta} - \delta_0)\right]^2.
\]
Let $\eta_i$ be any element $-2\xi_iX_i^P$ or of $X_i^P\dot{X}_i$. Also, let $\tilde{S}_{kg}$ be the $(k,g)^{th}$ element of $\tilde{S}$, and let $\Upsilon_{i,k} = \sum_{g=1}^G \tilde{S}_{kg}\mu_{gn}z_{ig}/\sqrt{n}$ and $u_{i,k}$ denote the $k^{th}$ element of $\Upsilon_i$ and $U_i$, respectively. Note that if
\[ \eta_i = -2\xi_i X_i^{P_i} e_k, \text{ then} \]

\[
E[\eta_i|Z] = \frac{E[\varepsilon_i u_{i,k}|Z]}{1 \{JIV1\} (1 - P_i)^2 + (1 - 1 \{JIV1\})},
\]

\[
Var[\eta_i|Z] = \frac{\gamma_i^2 E[\varepsilon_i^2|Z] + 2\gamma_i \varepsilon_i u_{i,k}|Z] + Var(\varepsilon_i u_{i,k}|Z)}{1 \{JIV1\} (1 - P_i)^4 + (1 - 1 \{JIV1\})},
\]

where \(1 \{JIV1\}\) is an indicator function which takes on the value of 1 for the case of \(JIV1\) and 0 for the case of \(JIV2\). On the other hand, if \(\eta_i = e_{i,k}' X_i^{P_i} e_{\ell}, \text{ then} \)

\[
E[\eta_i|Z] = \frac{\gamma_i \gamma_{i,\ell} + E[u_{i,k} u_{i,\ell}|Z]}{1 \{JIV1\} (1 - P_i)^2 + (1 - 1 \{JIV1\})},
\]

\[
Var[\eta_i|Z] = \left[1 \{JIV1\} (1 - P_i)^4 + (1 - 1 \{JIV1\}) \right]^{-1}
\times \left\{ \gamma_i^2 E[u_{i,\ell}|Z] + 2\gamma_i \gamma_{i,\ell} E[u_{i,k} u_{i,\ell}|Z] + \gamma_{i,\ell} E[u_{i,k}|Z] 
+ 2\gamma_i \gamma_{i,\ell} E[u_{i,k} u_{i,\ell}|Z] + Var(u_{i,k} u_{i,\ell}|Z) \right\}.
\]

Now, since \(\tilde{S}\) is finite by Assumption 2, we have that

\[
\max_{1 \leq i \leq n} |\gamma_{i,k}| = \max_{1 \leq i \leq n} \left| \sum_{g=1}^{G} \tilde{a}_{kg} \mu_{gn} z_{ig} / \sqrt{n} \right| \leq C \sum_{g=1}^{G} \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}|
\]

Moreover, with probability one \(\sup_{i,k} E\left[u_{i,k}^4|Z\right] \leq C < \infty, \sup_{i} E\left[\varepsilon_i^4|Z\right] \leq C < \infty, \text{ and } P_i \leq C < 1, \)

so that whether \(\eta_i = -2\xi_i X_i^{P_i} e_k \text{ or } e_{i,k}' X_i^{P_i} e_{\ell}, \text{ we can obtain overall upper bounds for the conditional mean and variance of the form:} \)

\[
\tilde{\mu}_{\eta}(Z) = \max_{1 \leq i \leq n} |E[\eta_i|Z]| \leq C \sum_{g=1}^{G} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}| \right) + C
\]

\[
\tilde{\sigma}_{\eta}(Z) = \max_{1 \leq i \leq n} Var[\eta_i|Z] \leq C \sum_{g=1}^{G} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}| \right)^2 + C \sum_{g=1}^{G} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}| \right)^4 + C
\]

It follows in this case that

\[
E_Z[\tilde{\mu}_{\eta}^2(Z)] \leq C \sum_{g=1}^{G} E_Z \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}| \right)^2 + C \leq C,
\]

\[
E_Z[\tilde{\sigma}_{\eta}^4(Z)] \leq C \sum_{g=1}^{G} E_Z \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}| \right)^4 + C \sum_{g=1}^{G} E_Z \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ig}| \right)^2 + C \leq C.
\]

Next, take \(W_i = e_{i,k}' \hat{X}_i \text{ and } Y_j = e_{j,\ell}' \hat{X}_j \text{ and let } \tilde{u}_{i,k} = e_{i,k}' S_n^{-1} U_i, \text{ and note that in this case} \)

\[
\tilde{w}_i = \frac{1}{\sqrt{n}} |z_{ik}|, \quad \tilde{y}_i = \frac{1}{\sqrt{n}} |z_{i\ell}|
\]

\[
\tilde{\mu}_W(Z) = \max_{1 \leq i \leq n} |\tilde{w}_i| = \frac{1}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ik}|, \quad \tilde{\mu}_Y(Z) = \max_{1 \leq i \leq n} |\tilde{y}_i| = \frac{1}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{i\ell}|,
\]

25
so that, by Assumption 2, we have that for $n$ sufficiently large, we have that with probability one

$$\sum_{i=1}^{n} \bar{w}_i = \frac{1}{n} \sum_{i=1}^{n} z_{ik}^2 \leq C, \quad \sum_{i=1}^{n} \bar{y}_i = \frac{1}{n} \sum_{i=1}^{n} z_{ik}^2 \leq C.$$

Moreover, for $n$ sufficiently large,

$$K^2 E_Z \left[ \hat{\mu}_V^2 (Z) \right] \leq E_Z \left( \sqrt{K} \max_{n \leq i \leq n} |z_{ik}| \right)^4 \leq C, \quad K^2 E_Z \left[ \hat{\mu}_V^4 (Z) \right] \leq E_Z \left( \sqrt{K} \max_{n \leq i \leq n} |z_{ik}| \right)^4 \leq C,$$

$$Var (W_i | Z) = E [\hat{u}_{i,k}^2 | Z] \leq C/r_n \ a.s. \ \mathbb{P}_Z, \ Var (Y_j | Z) = E [\hat{u}_{i,k}^2 | Z] \leq C/r_n \ a.s. \ \mathbb{P}_Z,$$

and

$$KE_Z \left[ \sigma_\eta^2 (Z) \hat{\mu}_V^2 (Z) \hat{\mu}_V^2 (Z) \right] \leq C \sum_{g=1}^{G} E_Z \left[ \frac{1}{K^{1/3}} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ig}| \right)^2 \left( \frac{K^{1/3}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ik}| \right)^2 \left( \frac{K^{1/3}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ik}| \right)^2 \right] + C \sum_{g=1}^{G} E_Z \left[ \left( \frac{K^{1/3}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ik}| \right)^2 \left( \frac{K^{1/3}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ik}| \right)^2 \right] + C E_Z \left( \frac{K^{1/3}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ik}| \right)^4 + C E_Z \left( \frac{K^{1/3}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ik}| \right)^4 \leq C \sum_{g=1}^{G} \frac{1}{K^{1/3}} E_Z \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{n \leq i \leq n} |z_{ig}| \right)^6 + C \frac{1}{K} E_Z \left( \sqrt{K} \max_{n \leq i \leq n} |z_{ik}| \right)^6 + C \frac{1}{K} E_Z \left( \sqrt{K} \max_{n \leq i \leq n} |z_{ik}| \right)^6 + \frac{1}{K} E_Z \left( \sqrt{K} \max_{n \leq i \leq n} |z_{ik}| \right)^4 + \frac{1}{K} E_Z \left( \sqrt{K} \max_{n \leq i \leq n} |z_{ik}| \right)^4 = O \left( K^{-1/3} \right) = o \left( 1 \right),$$

where the second inequality above follows from the arithmetic-geometric mean inequality and the third inequality follows from Loève’s $c_r$ inequality. Applying Lemma A4, we deduce that $\sum_{i \neq j \neq \ell} c_{k}^{i} \tilde{X}_i P_{ik} \eta_k P_{kj} X_{j}^{\ell} c_{\ell} = \text{...} = 26$
\[ O_p(1). \] Doing this for every element, we then get \( \sum_{i \neq j \neq k} \hat{X}_i P_{ik} \hat{\eta}_k P_{kj} \hat{X}_j' = O_p(1) \). Next, let \( \Delta_n \) denote a sequence of random variables converging to zero in probability, and it follows that

\[
\Delta \sum_{i \neq j \neq k} \hat{X}_i P_{ik} \hat{\eta}_k P_{kj} \hat{X}_j' = o_p(1) O_p(1) \xrightarrow{p} 0.
\]

From the above expression for \( \hat{\xi}_i^2 - \xi_i^2 \) we see that \( \hat{\Sigma}_1 - \Sigma_1 \) is a sum of terms of the form \( \hat{\Delta} \sum_{i \neq j \neq k} \hat{X}_i P_{ik} \hat{\eta}_k P_{kj} \hat{X}_j' \), so by the triangle inequality \( \hat{\Sigma}_1 - \hat{\Sigma}_1 \xrightarrow{p} 0 \).

Let \( d_i = \sum_{g=1}^{G} \mu_{gn} \max_{1 \leq i \leq n} |z_{i,g}| / \sqrt{n} + |\varepsilon_i| + \|U_i\| \), \( \hat{A} = (1 + \|\hat{\delta}\|) \) for JIV1, \( \hat{A} = (1 + \|\delta\|) \) for JIV2, \( \hat{B} = \|\hat{\delta} - \delta_0\| \) for JIV1, and \( \hat{B} = \|\delta - \delta_0\| \) for JIV2. By the conclusion of Theorem 1 we have \( \hat{A} = O_p(1) \) and \( \hat{B} \xrightarrow{p} 0 \). Also, by \( P_{ii} \) bounded away from 1, \( (1 - P_{ii})^{-1} \leq C \), so for both JIV1 and JIV2,

\[
\|X_i\| \leq \|Y_i\| + \|U_i\| \leq C \sqrt{\sum_{g=1}^{G} \left( \frac{\mu_{gn}}{n} \right) \varepsilon_{i,g}^2 + \|U_i\|} \leq C \sum_{g=1}^{G} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{i,g}| \right) + \|U_i\| \leq C d_i
\]

\[
\|X_i\| \leq C r_n^{-1/2} d_i, \quad \|\hat{X}_i - X_i\| \leq C X_i'(\hat{\delta} - \delta_0) \leq C d_i \hat{B},
\]

\[
\|\hat{\xi}_i\| \leq C |X_i'(\hat{\delta} - \delta)| + |\xi_i| \leq C d_i \hat{A},
\]

\[
|\hat{\xi}_i^2 - \xi_i^2| \leq \left( |\xi_i| + |\hat{\xi}_i| \right) |\hat{\xi}_i - \xi_i| \leq C d_i (1 + \hat{A}) d_i \hat{B} \leq C d_i^2 \hat{A} \hat{B},
\]

\[
\|\hat{X}_i (\hat{\xi}_i - \xi_i)\| \leq C r_n^{-1/2} d_i^2 \hat{B}, \quad \|\hat{X}_i \hat{\xi}_i\| \leq C r_n^{-1/2} d_i^2 \hat{A}, \quad \|\hat{X}_i \xi_i\| \leq C r_n^{-1/2} d_i^2.
\]

Also note that

\[
\max_{1 \leq i \leq n} E \left[ d_i^4 |Z \right] = \max_{1 \leq i \leq n} E \left[ \left( \sum_{g=1}^{G} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{i,g}| \right) + |\varepsilon_i| + \|U_i\| \right)^4 | Z \right] \leq C \sum_{g=1}^{G} \left( \frac{\mu_{gn}}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{i,g}| \right)^4 + \max_{1 \leq i \leq n} E \left[ |\varepsilon_i|^4 | Z \right] + \max_{1 \leq i \leq n} E \left[ \|U_i\|^4 | Z \right],
\]
and, thus, we have

\[
E \left[ \sum_{i \neq j} P_{ij}^2 d_i^2 d_j^2 r_n^{-1} \right] 
\leq C E_Z \left[ \sum_{i \neq j} P_{ij}^2 E \left[ d_i^4 \mid Z \right] r_n^{-1} + \sum_{i \neq j} P_{ij}^2 E \left[ d_j^4 \mid Z \right] r_n^{-1} \right] 
\leq C E_Z \left[ \max_{1 \leq i \leq n} E \left[ d_i^4 \mid Z \right] \sum_{i,j} P_{ij} r_n^{-1} \right] 
= C E_Z \left[ \max_{1 \leq i \leq n} E \left[ d_i^4 \mid Z \right] \sum_i P_{ii} r_n^{-1} \right] 
= C \left( \frac{K}{r_n} \right) E_Z \left[ \max_{1 \leq i \leq n} E \left[ d_i^4 \mid Z \right] \right] 
\leq C \left( \frac{K}{r_n} \right) \sum_{j=1}^G E_Z \left\{ \left( \frac{\mu_{ij} \max_{1 \leq i \leq n} |z_{i,j}|}{\sqrt{n}} \right)^4 \right\} + E_Z \left\{ \max_{1 \leq i \leq n} E \left[ |\varepsilon_i|^4 \mid Z \right] \right\} + E_Z \left\{ \max_{1 \leq i \leq n} E \left[ ||U_i||^4 \mid Z \right] \right\} 
\leq CK/r_n,
\]

where the third inequality above follows from Assumptions . Hence, we deduce by the Markov inequality that \( \sum_{i \neq j} P_{ij}^2 d_i^2 d_j^2 r_n^{-1} = O_p(K/r_n) \). It then follows that

\[
\left\| \sum_{i \neq j} P_{ij}^2 \left( \dot{X}_i \dot{X}_j \left( \xi_i^2 - \xi_j^2 \right) \right) \right\| \leq \sum_{i \neq j} P_{ij}^2 \left\| \dot{X}_i \right\|^2 \left\| \xi_i^2 - \xi_j^2 \right\| \leq Cr_n^{-1} \sum_{i \neq j} P_{ij}^2 d_i^2 d_j^2 \hat{A} \hat{B} = o_p \left( K/r_n \right).
\]

We also have

\[
\left\| \sum_{i \neq j} P_{ij}^2 \left( \dot{X}_i \xi_i \dot{X}_j - \dot{X}_i \xi_j \dot{X}_j \right) \right\| 
\leq \sum_{i \neq j} P_{ij}^2 \left( \left\| \dot{X}_i \xi_i \right\| \left\| \dot{X}_j \left( \xi_j - \xi_j \right) \right\| + \left\| \dot{X}_j \xi_j \right\| \left\| \dot{X}_i \left( \xi_i - \xi_i \right) \right\| \right) 
\leq Cr_n^{-1} \sum_{i \neq j} P_{ij}^2 d_i^2 d_j^2 \hat{A} \hat{B} = o_p \left( \frac{K}{r_n} \right).
\]

The second conclusion then follows by the triangle inequality. Q.E.D.

**Lemma A8:** If Assumptions 1-6 are satisfied then

\[
\dot{\Sigma}_1 = \sum_{i \neq j \neq k} z_i P_{ik} E \left[ \xi_k^2 \mid Z \right] P_{kj} z'_j / n + o_p(1), \\
\dot{\Sigma}_2 = \sum_{i \neq j} P_{ij}^2 z_i z'_i E \left[ \xi_j^2 \mid Z \right] / n \\
+ S_n^{-1} \sum_{i \neq j} P_{ij}^2 \left( E \left[ U_i U'_i \mid Z \right] E \left[ \xi_j^2 \mid Z \right] + E \left[ U_i \xi_i \mid Z \right] E \left[ \xi_j U'_j \mid Z \right] \right) S_n^{-1} U + O_p(\sqrt{\epsilon_n}),
\]

28
Proof: To prove the first conclusion apply Lemma A4 with $W_i$ equal to an element of $\dot{X}_i$, $Y_j$ equal to an element of $\dot{X}_j$, and $\eta_k = \xi_k^2$.

Next, note that $Var(\xi_1^2 | Z) \leq C$ a.s. $P_Z$ and $r_n \leq C_n$, so that for $\bar{u}_{i,k} = e_k^* S_n^{-1} U_i$,

$$E[(\dot{X}_{ik}\dot{X}_{i\ell})^2 | Z] \leq CE\dot{X}_{ik}^4 + \dot{X}_{i\ell}^4 | Z] \leq C \left\{ z_{ik}^4/n^2 + E[\bar{u}_{i,k}^4 | Z] + z_{i\ell}^4/n^2 + E[\bar{u}_{i,\ell}^4 | Z] \right\}$$

$$\leq C \left[ \left( \frac{1}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{ik}| \right)^4 + \left( \frac{1}{\sqrt{n}} \max_{1 \leq i \leq n} |z_{i\ell}| \right)^4 + r_n^{-2} \right] \text{ a.s. } P_Z,$n

$$E[(\dot{X}_{ik}\xi_1^2) | Z] \leq CE[\xi_1^4 | Z]$$

$$\leq \left[ \sqrt{\left( n^{-1/2} \max_{1 \leq i \leq n} |z_{ik}| \right)^4 \sqrt{E[\xi_1^4 | Z]} + \sqrt{E[\bar{u}_{i,k}^4 | Z]} \sqrt{E[\xi_1^4 | Z]} \right]$$

$$\leq \left[ n^{-1/2} \max_{1 \leq i \leq n} \left| E[\xi_1^4 | Z] \right| \right] \left[ n^{-1/2} \max_{1 \leq i \leq n} \left| z_{ik} \right| \right] + r_n^{-1} \right] \text{ a.s. } P_Z.

Also, we have, for $\Omega_i (Z) = E[U_i U_i' | Z]$,

$$E \left[ \dot{X}_i \dot{X}_i' | Z \right] = z_i \xi_i^2/n + S_n^{-1} \Omega_i (Z) S_n^{-1}, E \left[ \dot{X}_i \xi_i | Z \right] = S_n^{-1} E \left[ U_i \xi_i | Z \right].$$

Next let $W_i$ be $e_k^* \dot{X}_i e_{i\ell}$ for some $k$ and $\ell$, and note that

$$E \left[ W_i | Z \right] = e_k^* S_n^{-1} E \left[ U_i U_i' | Z \right] S_n^{-1} e_{i\ell} + z_i \xi_i/n,$n

so that

$$\max_{1 \leq i \leq n} \left| E[\dot{W}_i | Z] \right| \leq C \left[ \left( n^{-1/2} \max_{1 \leq i \leq n} |z_{ik}| \right)^2 + \left( n^{-1/2} \max_{1 \leq i \leq n} |z_{i\ell}| \right)^2 + r_n^{-1} \right] \text{ a.s. } P_Z.$n

Moreover,

$$\max_{1 \leq i \leq n} Var \left( W_i | Z \right) = \max_{1 \leq i \leq n} \left[ Var \left\{ \left( \bar{u}_{i,k} + z_i \xi_i/\sqrt{n} | Z \right) \left( \bar{u}_{i,\ell} + z_i \xi_i/\sqrt{n} | Z \right) \right\} \right]$$

$$= \max_{1 \leq i \leq n} \left\{ \frac{n^-1}{2} z_{ik} E \left[ \bar{u}_{i,k}^2 | Z \right] + 2n^{-1} z_{ik} z_{i\ell} E \left[ \bar{u}_{i,k} \bar{u}_{i,\ell} | Z \right] + n^{-1} z_{i\ell} E \left[ \bar{u}_{i,\ell}^2 | Z \right] \right\}$$

$$+ 2n^{-1/2} z_{ik} E \left[ \bar{u}_{i,k} \bar{u}_{i,k}^2 | Z \right] + 2n^{-1/2} z_{i\ell} E \left[ \bar{u}_{i,\ell} \bar{u}_{i,\ell}^2 | Z \right] + Var \left( \bar{u}_{i,k} \bar{u}_{i,\ell} | Z \right) \right\}$$

$$\leq C \left[ r_n^{-1} \left( n^{-1/2} \max_{1 \leq i \leq n} |z_{ik}| \right)^2 + r_n^{-1} \left( n^{-1/2} \max_{1 \leq i \leq n} |z_{i\ell}| \right)^2 + r_n^{-3/2} \left( n^{-1/2} \max_{1 \leq i \leq n} |z_{ik}| \right) \right. \right.$$

$$\left. + \left. r_n^{-3/2} \left( n^{-1/2} \max_{1 \leq i \leq n} |z_{i\ell}| \right) + r_n^{-2} \right] \text{ a.s. } P_Z.$$
Also let $Y_i = \xi_i^2$. Then, applying Lemma A3 for this $W_i$ and $Y_i$ gives that with probability one in $P_Z$

$$\left\| \sum_{i \neq j} P_{ij}^2 e_k^i \hat{X}_i \hat{X}_j^t \xi_j^2 - \sum_{i \neq j} P_{ij}^2 (z_{ik} z_{it} / n + S_n^{-1} \Omega_i (Z) S_n^{-1}) E [\xi_j^2 | Z] \right\|_{L_2, Z}^2 \leq CK(\sigma_{W_n}^2 \sigma_{Y_n}^2 + \sigma_{W_n}^2 \bar{\mu}_{Y_n} + \bar{\mu}_{W_n} \sigma_{Y_n}^2)$$

$$\leq C \left\{ \frac{1}{K} \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{ik}|} \right)^4 + \frac{1}{K} \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{it}|} \right)^4 + r_n^{-1} \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{ik}|} \right)^2 + r_n^{-1} \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{it}|} \right)^2 \right\}.$$

Taking expectation with respect to the distribution of $Z$ and theorem 16.1 of Billingsley (1986), we get

$$E \left( \sum_{i \neq j} P_{ij}^2 e_k^i \hat{X}_i \hat{X}_j^t \xi_j^2 - \sum_{i \neq j} P_{ij}^2 (z_{ik} z_{it} / n + e_k^i S_n^{-1} \Omega_i (Z) S_n^{-1}) E [\xi_j^2 | Z] \right)^2 \leq C \left\{ \frac{1}{K} E_Z \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{ik}|} \right)^4 + \frac{1}{K} E_Z \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{it}|} \right)^4 + r_n^{-1} E_Z \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{ik}|} \right)^2 + r_n^{-1} E_Z \left( \sqrt{\frac{K}{n} \max_{1 \leq i \leq n} |z_{it}|} \right)^2 \right\}$$

$$= O \left( \epsilon_n \right) = o \left( 1 \right),$$

where $\epsilon_n = \max \{ K/r_n^2, 1/K \}$. It follows by M that

$$\sum_{i \neq j} P_{ij}^2 e_k^i \hat{X}_i \hat{X}_j^t \xi_j^2 = \sum_{i \neq j} P_{ij}^2 (z_{ik} z_{it} / n + e_k^i S_n^{-1} \Omega_i (Z) S_n^{-1}) E [\xi_j^2 | Z] + O_p(\sqrt{\epsilon_n}).$$

Do this for every element of $\hat{X}_i \hat{X}_j^t$ then yields the representation

$$\sum_{i \neq j} P_{ij}^2 \hat{X}_i \hat{X}_j^t \xi_j^2 = \sum_{i \neq j} P_{ij}^2 (z_{ik} z_{it} / n + S_n^{-1} \Omega_i (Z) S_n^{-1}) E [\xi_j^2 | Z] + O_p(\sqrt{\epsilon_n}).$$

Now, by a similar argument using Lemma A3 and taking $W_i$ and $Y_i$ to be elements of $\hat{X}_i \xi_i$, we can show that

$$\sum_{i \neq j} P_{ij}^2 \hat{X}_i \xi_i \xi_j^t \hat{X}_j = S_n^{-1} \sum_{i \neq j} P_{ij}^2 E [U_i \xi_i | Z] E [\xi_j U_j^t | Z] S_n^{-1} + O_p(\sqrt{\epsilon_n}).$$
The second conclusion then follows by T. Q.E.D.

**Proof of Theorem 4**: Note that $\hat{X}_i = \sum_{j=1}^{n} P_{ij} X_j$, so that

$$
\sum_{i=1}^{n} (\hat{X}_i \hat{X}'_i - \hat{X}_i P_{ii} \hat{X}'_i - \hat{X}_i P_{ii} X'_i) \hat{\xi}_i^2
$$

$$
= \sum_{i,j,k=1}^{n} P_{ik} P_{kj} X_i X'_j \hat{\xi}_k^2 - \sum_{i,j=1}^{n} P_{ii} P_{ij} X_i X'_j \hat{\xi}_i^2 - \sum_{i,j=1}^{n} P_{ij} P_{jj} X_i X'_j \hat{\xi}_j^2
$$

$$
= \sum_{i,j,k=1}^{n} P_{ik} P_{kj} X_i X'_j \hat{\xi}_k^2 - \sum_{i,j=1}^{n} P_{ii} P_{ij} X_i X'_j \hat{\xi}_i^2 - \sum_{i,j=1}^{n} P_{ij} P_{jj} X_i X'_j \hat{\xi}_j^2 - 2 \sum_{i=1}^{n} P_{ii}^2 X_i \hat{\xi}_i^2
$$

$$
= \sum_{i,j,k=1}^{n} P_{ik} P_{kj} X_i X'_j \hat{\xi}_k^2 - \sum_{i,j=1}^{n} P_{ii}^2 X_i \hat{\xi}_i^2
$$

Also, for $Z'_i$ and $\hat{Z}'_i$ equal to the ith row of $Z$ and $\hat{Z} = Z(Z'Z)^{-1}$ we have

$$
\sum_{k=1}^{K} \sum_{\ell=1}^{K} \left( \sum_{i=1}^{n} \hat{Z}_{ik} \hat{Z}_{\ell i} X_i \hat{\xi}_i \right) \left( \sum_{j=1}^{n} Z_{jk} Z_{\ell j} X_j \hat{\xi}_j \right)'
$$

$$
= \sum_{i,j=1}^{n} \left( \sum_{k=1}^{K} \sum_{\ell=1}^{K} \hat{Z}_{ik} Z_{jk} \hat{Z}_{\ell i} Z_{\ell j} \right) X_i \hat{\xi}_i \hat{\xi}_j X'_j = \sum_{i,j=1}^{n} \left( \sum_{k=1}^{K} \hat{Z}_{ik} Z_{jk} \right)^2 X_i \hat{\xi}_i \hat{\xi}_j X'_j
$$

Adding this equation to the previous one then gives

$$
\hat{\Sigma} = \sum_{i,j,k=1}^{n} P_{ik} P_{kj} X_i X'_j \hat{\xi}_k^2 + \sum_{i,j=1}^{n} P_{ii}^2 X_i \hat{\xi}_i^2 - \sum_{i,j=1}^{n} P_{ii}^2 X_i X'_j \hat{\xi}_j^2 + \sum_{i,j=1}^{n} P_{ii}^2 X_i \hat{\xi}_i \hat{\xi}_j X'_j
$$

$$
= \sum_{i,j,k=1}^{n} P_{ik} P_{kj} X_i X'_j \hat{\xi}_k^2 + \sum_{i,j=1}^{n} P_{ii}^2 (X_i X'_j \hat{\xi}_j^2 + X_i \hat{\xi}_i \hat{\xi}_j X'_j),
$$

giving the equality in Section 2.

Let $\sigma_i^2 = E [\xi_i^2 | Z]$ and $\tilde{z}_i = \sum_j P_{ij} z_j = e'_i P z$. Then
\[
\sum_{i \neq j \neq k} z_i P_{ik} \hat{\sigma}_k^2 P_{kj} z_j'/n = \sum_{i \neq j} \sum_{k \notin \{i, j\}} z_i P_{ik} \hat{\sigma}_k^2 P_{kj} z_j'/n = \\
\sum_{i \neq j} \sum_{k \notin \{i, j\}} \left( \sum_{i} z_i P_{ik} \hat{\sigma}_k^2 P_{kj} z_j' - z_i P_{ii} \hat{\sigma}_i^2 P_{ij} z_j' - z_i P_{ij} \hat{\sigma}_j^2 P_{jj} z_j' \right) /n = \\
\sum_{i} \left( \sum_{j \neq i} \sum_{k \notin \{i, j\}} z_i P_{ik} \hat{\sigma}_k^2 P_{kj} z_j' - z_i P_{ii} \hat{\sigma}_i^2 P_{ij} z_j' - z_i P_{ij} \hat{\sigma}_j^2 P_{jj} z_j' \right) /n = \\
\sum_{i} \hat{\sigma}_i^2 \left( \bar{z}_i z_i' - P_{ii} \bar{z}_i z_i' - P_{ii} \bar{z}_i z_i' + P_{ii} \bar{z}_i z_i' \right) /n - \sum_{i \neq j} P_{ij} z_i z'_j \hat{\sigma}_j^2 /n.
\]

Also, as shown above, Assumption 4 implies that \( \sum_i \|z_i - \bar{z}_i\|^2 /n \leq z'(I - P)z/n \rightarrow 0 \) with probability one. Then by \( \hat{\sigma}_i^2 \) and \( P_{ii} \) bounded a.s. \( P_Z \), we have with probability one

\[
\left\| \sum_i \hat{\sigma}_i^2 (\bar{z}_i z_i' - z_i z_i') /n \right\| \leq \sum_i \hat{\sigma}_i^2 (2 \|z_i\| + \|z_i - \bar{z}_i\|) /n \leq C \sum_i \|z_i - \bar{z}_i\|^2 /n \rightarrow 0,
\]

\[
\left\| \sum_i \hat{\sigma}_i^2 P_{ii} (z_i z_i' - z_i z_i') /n \right\| \leq (\sum_i \hat{\sigma}_i^4 P_{ii}^2 \|z_i\|^2 /n)^{1/2} (\sum_i \|z_i - \bar{z}_i\|^2 /n)^{1/2} \rightarrow 0.
\]

It follows that

\[
\sum_{i \neq j \neq k} z_i P_{ik} \hat{\sigma}_k^2 P_{kj} z_j'/n = \sum_i \hat{\sigma}_i^2 (1 - P_{ii})^2 z_i z_i'/n - \sum_{i \neq j} P_{ij}^2 z_i z_i' \hat{\sigma}_j^2 /n + o_{a.s.}(1).
\]

It then follows by Lemmas A7 and A8 and the triangle inequality that

\[
\hat{\Sigma}_1 + \hat{\Sigma}_2 = \sum_{i \neq j \neq k} z_i P_{ik} \hat{\sigma}_k^2 P_{kj} z_j'/n + \sum_{i \neq j} P_{ij}^2 z_i z_i' \hat{\sigma}_j^2 /n + \sum_{i \neq j} P_{ij}^2 (E[U_i U_i'|Z] \hat{\sigma}_j^2 + E[U_i \xi_i|Z] E[\xi_i U_i'|Z]) S_n^{-1} + o_p(1) + o_p(\sqrt{\epsilon_n}) + o_p(K/r_n)
\]

\[
= \sum_i \hat{\sigma}_i^2 (1 - P_{ii})^2 z_i z_i'/n + \sum_{i \neq j} P_{ij}^2 (E[U_i U_i'|Z] \hat{\sigma}_j^2 + E[U_i \xi_i|Z] E[\xi_i U_i'|Z]) S_n^{-1} + o_p(1) + o_p(K/r_n)
\]

since \( \epsilon_n \rightarrow 0 \). Then for JIV1, where \( \xi_i = \epsilon_i/(1 - P_{ii}) \) and \( \hat{\sigma}_i^2 = \sigma_i^2/(1 - P_{ii})^2 \), we have

\[
\hat{\Sigma}_1 + \hat{\Sigma}_2 = \Omega_n + \Psi_n + o_p(1) + o_p(K/r_n).
\]

32
For JIV2, where $\xi_i = \varepsilon_i$ and $\hat{\sigma}_i^2 = \sigma_i^2$, we have
\[ \hat{\Sigma}_1 + \hat{\Sigma}_2 = \Omega_n + \Psi_n + o_p(1) + o_p(K/r_n). \]

Consider the case where $K/r_n$ is bounded, implying $o_p(K/r_n) = o_p(1)$. Then, since $\hat{H}_n^{-1}$, $\Omega_n + \Psi_n$, $H_n^{-1}$, and $\Omega_n + \Psi_n$ are all bounded $a.s.$ $P$ for $n$ sufficiently large, we have, making use of Lemma A6,
\[ S_n' \hat{V} S_n = \left( S_n^{-1} \hat{H} S_n^{-1} \right)^{-1} \left( \hat{\Sigma}_1 + \hat{\Sigma}_2 \right) \left( S_n^{-1} \hat{H}' S_n^{-1} \right)^{-1} \]
\[ = \left( \hat{H}_n^{-1} + o_p(1) \right) \left( \Omega_n + \tilde{\Psi}_n + o_p(1) \right) \left( \hat{H}_n^{-1} + o_p(1) \right) = \tilde{V}_n + o_p(1). \]
\[ S_n' \hat{V} S_n = V_n + o_p(1), \]
giving the first conclusion.

Next, consider the case where $K/r_n \to \infty$. Then for JIV1, where $\xi_i = \varepsilon_i/(1 - P_{ii})$ and $\hat{\sigma}_i^2 = \sigma_i^2/(1 - P_{ii})^2$, the almost sure boundedness of $\hat{O}_n$ for $n$ sufficiently large implies that we have
\[ (r_n/K) \left( \hat{\Sigma}_1 + \hat{\Sigma}_2 \right) = (r_n/K) \Omega_n + (r_n/K) \tilde{\Psi}_n + (r_n/K) o_p(1) + o_p(1) \]
\[ = (r_n/K) \tilde{\Psi}_n + o_p(1). \]

For JIV2, where $\xi_i = \varepsilon_i$ and $\hat{\sigma}_i^2 = \sigma_i^2$, we have
\[ (r_n/K) \left( \hat{\Sigma}_1 + \hat{\Sigma}_2 \right) = (r_n/K) \Omega_n + (r_n/K) \Psi_n + (r_n/K) o_p(1) + o_p(1) \]
\[ = (r_n/K) \Psi_n + o_p(1). \]

Then by the fact that $\hat{H}_n^{-1}$, $(r_n/K) \tilde{\Psi}_n$, $H_n^{-1}$, and $(r_n/K) \Psi_n$ are all bounded with probability one for $n$ sufficiently large and by Lemma A6,
\[ S_n' \hat{V} S_n = \left( S_n^{-1} \hat{H} S_n^{-1} \right)^{-1} \left( \hat{\Sigma}_1 + \hat{\Sigma}_2 \right) \left( S_n^{-1} \hat{H}' S_n^{-1} \right)^{-1} \]
\[ = \left( \hat{H}_n^{-1} + o_p(1) \right) \left( r_n \tilde{\Psi}_n/K_n + o_p(1) \right) \left( \hat{H}_n^{-1} + o_p(1) \right) = \tilde{V}_n^* + o_p(1). \]
\[ S_n' \hat{V} S_n = V_n^* + o_p(1), \]
giving the second conclusion. Q.E.D.

**Proof of Theorem 5:** An expansion gives
\[ a(\hat{\delta}) - a(\delta_0) = \tilde{A}(\hat{\delta} - \delta_0) \]
for $\bar{A} = \partial a(\delta)/\partial \delta$ where $\delta$ lies on the line joining $\hat{\delta}$ and $\delta_0$ and actually differs from element to element of $a(\delta)$. It follows by $\hat{\delta} \rightarrow P \delta_0$ that $\delta - P \delta_0$, so that by condition iii), $B_n\bar{A}S_n^{-1} = B_nAS_n^{-1} + o_p(1)$. Then multiplying by $B_n$ and using the conclusion of Theorem 4 we have

$$
(\bar{A}V \bar{A})^{-1/2} \left[ a(\hat{\delta}) - a(\delta_0) \right] = (B_n\bar{A}S_n^{-1}V_n\bar{A}S_n^{-1}B'_n)^{-1/2} B_n\bar{A}S_n^{-1}S'_n \left( \hat{\delta} - \delta_0 \right)
$$

$$
= \left[ (B_nAS_n^{-1} + o_p(1)) (V_n + o_p(1)) (S_n^{-1}AB'_n + o_p(1)) \right]^{-1/2}
$$

$$
\times (B_nAS_n^{-1} + o_p(1)) S'_n \left( \hat{\delta} - \delta_0 \right)
$$

$$
= (B_nAS_n^{-1}V_nS_n^{-1}A'B'_n)^{-1/2} B_nAS_n^{-1}S'_n \left( \hat{\delta} - \delta_0 \right) + o_p(1)
$$

$$
= (F_nF'_n)^{-1/2} F_n\tilde{Y}_n + o_p(1)
$$

for $F_n = B_nAS_n^{-1}V_n^{-1/2}$ and $\tilde{Y}_n = V_n^{-1/2}S'_n (\delta - \delta_0)$, and note that the third equality above follows from the Slutsky Theorem given the continuity of the square root matrix. By Theorem 2, $\tilde{Y}_n \rightarrow d N(0, I_G)$. Then since $L_n = (F_nF'_n)^{-1/2}F_n$ satisfies $L_nL'_n = I$, it follows from the Slutsky Theorem and standard convergence in distribution results that

$$
(\bar{A}V \bar{A})^{-1/2} \left[ a(\hat{\delta}) - a(\delta_0) \right] = L_n\tilde{Y}_n + o_p(1) \rightarrow d N(0, I),
$$

giving the conclusion. Q.E.D.

Proof of Corollary 6: Let $a(\hat{\delta}) = c'\hat{\delta}$, so that $\bar{A} = A = c'$. Note that condition i) of Theorem 5 is satisfied. Let $B_n = b_n$. Then $B_nAS_n^{-1} = b_n c'S_n^{-1}$ is bounded by hypothesis so condition ii) of Theorem 5 is satisfied. Also, $B_n(\bar{A} - A)S_n^{-1} = 0$ so condition iii) of Theorem 5 is satisfied. If $K/r_n$ is bounded then by hypothesis, $\lambda_{\min}(B_nAS_n^{-1}V_nS_n^{-1}A'B'_n) = b^2_n c'S_n^{-1}V_nS_n^{-1}c \geq C$ or if $K/r_n \rightarrow \infty$ then $\lambda_{\min}(B_nAS_n^{-1}V_nS_n^{-1}A'B'_n) = b^2_n c'S_n^{-1}V_nS_n^{-1}c \geq C$, giving the first conclusion. The second conclusion follows similarly. Q.E.D.

6 Appendix B - Proofs of Lemmas A2 and A4

We first give a series of Lemmas that will be useful for the proofs of Lemmas A2 and A4.

**Lemma B1:** For any subset $I_2$ of the set $\{(i, j)^n_{i, j = 1}\}$ and any subset $I_3$ of $\{(i, j, k)^n_{i, j, k = 1}\}$, (a) $\sum_{I_2} P_{ij}^4 \leq K$; (b) $\sum_{I_3} P_{ij}^2 P_{jk}^2 \leq K$; and (c) $\sum_{I_3} \left| P_{ij}^2 P_{ik} P_{jk} \right| \leq K$, with probability one for $n$ sufficiently large.
Proof: By Assumption 2, $Z'Z$ is nonsingular with probability one for $n$ sufficiently large. Also, by $P$ idempotent, $\text{rank}(P) = \text{tr}(P) = K$, $0 \leq P_{ii} \leq 1$, and $\sum_{j=1}^{n} P_{ij}^2 = P_{ii}$. Therefore, with probability one for $n$ large enough,

\[
\sum_{i,j=1}^{n} P_{ij}^2 \leq \sum_{i=1}^{n} P_{ii} = K,
\]

\[
\sum_{i,j,k,l=1}^{n} P_{ij}^2 P_{jk}^2 \leq \sum_{j=1}^{n} \left( \sum_{i=1}^{n} P_{ij}^2 \right)^2 \leq \sum_{j=1}^{n} P_{jj} = K,
\]

\[
\sum_{i,j,k,l=1}^{n} P_{ij}^2 P_{ik} P_{jk} P_{kl} \leq \sum_{i,j} \left( \sum_{k} P_{ik} P_{jk} P_{kl} \right) \leq \sum_{i,j} \left( \sum_{k} P_{ik}^2 \right) \left( \sum_{k} P_{jk}^2 \right) \leq \sum_{i,j} P_{ij}^2 = K.
\]

For the next result let $S_n = \sum_{i < j < k < l} (P_{ik} P_{jk} P_{kl} P_{il} + P_{ij} P_{jk} P_{il} P_{kl} + P_{ij} P_{ik} P_{jl} P_{kl})$.

Lemma B2: If Assumption 2 is satisfied then with probability one for $n$ sufficiently large, a) $\text{tr} \left[ (P - D)^4 \right] \leq CK$; b) $\sum_{i < j < k < l} P_{ik} P_{jk} P_{il} P_{kl} \leq CK$, and c) $|S_n| \leq CK$, where $D = \text{diag}(P_{11}, \ldots, P_{nn})$.

Proof: To show part (a), note that

\[
(P - D)^4 = (P - PD - DP + D^2)^2 = P - PD - PDP + PD^2 - PDP + PDPD + PD^2P - PD^3 - D^2P + DPD + D^2PD - DPD^2 + D^2P - D^2PD - D^3P + D^4.
\]

Note that $\text{tr}(A^t) = \text{tr}(A)$ and $\text{tr}(AB) = \text{tr}(BA)$ for any square matrices $A$ and $B$. Then,

\[
\text{tr} \left[ (P - D)^4 \right] = \text{tr}(P) - 4\text{tr}(PD) + 4\text{tr}(PD^2) + 2\text{tr}(PDPD) - 4\text{tr}(PD^3) + \text{tr}(D^4).
\]

By $0 \leq P_{ii} \leq 1$ we have $D^i \leq I$ for any integer and $\text{tr}(PD^i) = \text{tr}(PD^iP) \leq \text{tr}(P) = K$ with probability one for $n$ sufficiently large. Also, with probability one for $n$ sufficiently large, $\text{tr}(PDPD) = \text{tr}(PDPDP) \leq \text{tr}(PD^2P) \leq \text{tr}(P) = K$ and $\text{tr}(D^4) = \sum_i P_{ii}^4 \leq K$. Therefore, by T we have

\[
|\text{tr} \left[ (P - D)^4 \right]| \leq 16K,
\]

giving conclusion a).
Next, let $L$ be the lower triangular matrix with $L_{ij} = P_{ij}1(i > j)$. Then $P = L + L' + D$ so
\[
(P - D)^4 = (L + L')^4 = (L^2 + LL' + L'L + L'^2)^2
\]
\[
= L^4 + L^2LL' + L^2L'L + L^2L'^2 + LL'LL' + LL'L'L + LL'^3
+ L'LL^2 + L'LL'L' + L'L'L'L' + L'^2L^2 + L'^2L'L + L'^4
\]

Note that for an integer $j; [(L')^j] = L^j$. Then using $\text{tr}(AB) = \text{tr}(BA)$ and $\text{tr}(A^t) = \text{tr}(A)$,
\[
\text{tr}((P - D)^4) = 2\text{tr}(L^4) + 8\text{tr}(L^3L') + 4\text{tr}(L^2L'^2)
\]
\[+ 2\text{tr}(L'LL'L)
\]

Next, compute each of the terms. Note that
\[
\text{tr}(L^4) = \sum_{i,j,k,l} P_{ij}1(i > j)P_{jk}1(j > k)P_{kl}1(k > \ell)P_{\ell i}1(\ell > i) = 0.
\]
\[
\text{tr}(L^2L') = \sum_{i,j,k,l} P_{ij}1(i > j)P_{jk}1(j > k)P_{kl}1(\ell > k)P_{\ell i}1(i > \ell) = \sum_{i,j,k,l} P_{ij}P_{jk}P_{kl}P_{\ell i}
\]
\[
= \sum_{\ell < k < j < i} P_{ij}P_{jk}P_{kl}P_{\ell i} = \sum_{i < j < k < \ell} P_{ik}P_{kj}P_{ji}P_{\ell i} = \sum_{i < j < k < \ell} P_{ij}P_{jk}P_{kl}P_{\ell i}
\]
\[
\text{tr}(L^2L'^2) = \sum_{i,j,k,l} P_{ij}1(i > j)P_{jk}1(j > k)P_{kl}1(\ell > k)P_{\ell i}1(\ell > i) = \sum_{i,j,k,l} P_{ij}P_{jk}P_{kl}P_{\ell i}
\]
\[
= \sum_{i > j = \ell > k} P_{ij}P_{jk}P_{kl}P_{\ell i} + \sum_{i > j > \ell > k} P_{ij}P_{jk}P_{kl}P_{\ell i} + \sum_{i > j > k > \ell} P_{ij}P_{jk}P_{kl}P_{\ell i}
\]
\[
= \sum_{i > j > k} P_{ij}P_{jk}P_{kl} + \sum_{i < j < \ell} (P_{ik}P_{kj}P_{ji} + P_{ij}P_{ji}P_{ik}P_{kl})
\]
\[
= \sum_{i < j} P_{ij}^2P_{jk}^2 + 2\sum_{i < j < \ell} P_{ik}P_{kl}P_{ij}P_{ji}
\]
\[
\text{tr}(LL'LL') = \sum_{i,j,k,l} P_{ij}1(i > j)P_{jk}1(j > k)P_{kl}1(\ell > i)P_{\ell i}1(\ell > i)
\]
\[
= \sum_{j < i} P_{ij}P_{ji}P_{ij} + \sum_{j < i} P_{ij}P_{jk}P_{kj}P_{ji} + \sum_{j < i} P_{ij}P_{jk}P_{kj}P_{ji} + \sum_{j < i} P_{ij}P_{ji}P_{\ell i}P_{\ell i}
\]
\[
+ \sum_{\ell < i} P_{ij}P_{ji}P_{\ell i}P_{\ell i} + \left(\sum_{j < i} + \sum_{j < i} + \sum_{j < i} + \sum_{j < i}\right) P_{ij}P_{jk}P_{kl}P_{\ell i}
\]
\[
= \sum_{i < j} P_{ij}^4 + 2\sum_{i < j < k} (P_{ij}^2P_{ik}^2 + P_{ik}^2P_{jk}^2) + 4\sum_{i < j < \ell} P_{ik}P_{kj}P_{ji}P_{\ell i}
\]
Summing up gives the result
\[
\text{tr}((P - D)^4) = 2 \sum_{i<j} P_{ij}^4 + 4 \sum_{i<j<k} (P_{ij}^2 P_{jk}^2 + P_{ik}^2 P_{jk}^2 + P_{ij}^2 P_{ik}^2) + 8S_n.
\]

Then by the triangle inequality and Lemma B1 we have
\[
|S_n| \leq (1/4) \sum_{i<j} P_{ij}^4 + 1/2 \sum_{i<j<k} (P_{ij}^2 P_{jk}^2 + P_{ik}^2 P_{jk}^2 + P_{ij}^2 P_{ik}^2) + (1/8) \text{tr}((P - D)^4) \leq CK,
\]
with probability one for \( n \) sufficiently large, thus, giving part c). That is, \( S_n = O_{a.s.}(K) \).

To show part (b), take \( \{\varepsilon_i\} \) to be a sequence of i.i.d. random variables with mean 0 and variance 1 and where \( \varepsilon_i \) and \( Z \) are independent for all \( i \) and \( n \). Define the random quantities
\[
\Delta_1 = \sum_{i<j<k} [P_{ij} P_{ik} \varepsilon_j \varepsilon_k + P_{ij} P_{jk} \varepsilon_i \varepsilon_k + P_{ik} P_{jk} \varepsilon_i \varepsilon_j],
\]
\[
\Delta_2 = \sum_{i<j<k} [P_{ij} P_{ik} \varepsilon_j \varepsilon_k + P_{ij} P_{jk} \varepsilon_i \varepsilon_k], \Delta_3 = \sum_{i<j<k} P_{ik} P_{jk} \varepsilon_i \varepsilon_j.
\]

Note that by Lemma A1,
\[
E[\Delta_3^2 | Z] = E \left[ \sum_{i<j<k} P_{ik} P_{jk} P_{il} P_{jl} \sum_{i<j<k} (P_{iq} P_{mq} \varepsilon_i \varepsilon_m) | Z \right] = \sum_{i<j<k} P_{ik} P_{jk} \sum_{i<j<k} (P_{ij})^2 (P_{jk})^2 + 2 \sum_{i<j<k<\ell} P_{ik} P_{jk} P_{il} P_{jl} = O_{a.s.}(K) + 2 \sum_{i<j<k<\ell} P_{ik} P_{jk} P_{il} P_{jl}.
\]

Also, note that
\[
E[\Delta_2 \Delta_3 | Z] = E \left[ \sum_{i<j<k} (P_{ij} P_{ik} \varepsilon_j \varepsilon_k + P_{ij} P_{jk} \varepsilon_i \varepsilon_k) \sum_{i<m<\ell} P_{iq} P_{mq} \varepsilon_i \varepsilon_m | Z \right] = \sum_{i<j<k<\ell} P_{ij} P_{ik} P_{jl} P_{kt} + \sum_{i<j<k<\ell} P_{ij} P_{jk} P_{il} P_{kt}.
\]
and

\[
E \left[ \Delta_2^2 | Z \right] = E \left[ \left( \sum_{i<j<k} P_{ij} P_{ik} \varepsilon_i \varepsilon_k + P_{ij} P_{jk} \varepsilon_i \varepsilon_k \right) \times \left( \sum_{\ell<m<n} P_{\ell m} P_{\ell q} \varepsilon_m \varepsilon_q + P_{\ell m} P_{m q} \varepsilon_m \varepsilon_q \right) | Z \right] \\
= \sum_{\{i,\ell\} < j < k} P_{ij} P_{ik} P_{\ell j} P_{\ell k} + \sum_{i < \{j, m\} < k} P_{ij} P_{jk} P_{im} P_{mk} \\
+ \sum_{i < j < m < k} P_{ij} P_{ik} P_{jm} P_{mk} + \sum_{\ell < i < j < k} P_{ij} P_{jk} P_{i\ell} P_{\ell k} \\
= \sum_{i < j < k} P_{ij}^2 P_{ik}^2 + \sum_{i < j < k} P_{ij}^2 P_{jk}^2 + 2 \sum_{i < \ell < j < k} P_{ij} P_{ik} P_{\ell j} P_{\ell k} + 2 \sum_{i < j < m < k} P_{ij} P_{jk} P_{im} P_{mk} \\
+ \sum_{i < j < k < \ell} P_{ij} P_{i\ell} P_{jk} P_{k\ell} + \sum_{i < j < k < \ell} P_{jk} P_{k\ell} P_{i\ell} P_{i\ell} \\
= \sum_{i < j < k} P_{ij}^2 P_{ik}^2 + \sum_{i < j < k} P_{ij}^2 P_{jk}^2 + 2 S_n = O_{a.s.}(K).
\]

Since \( \Delta_1 = \Delta_2 + \Delta_3 \), it follows that

\[
E \left[ \Delta_1^2 | Z \right] = E \left[ \Delta_2^2 | Z \right] + 2 E \left[ \Delta_2 \Delta_3 | Z \right] = O_{a.s.}(K) + 2 S_n = O_{a.s.}(K).
\]

Therefore, by T, the expression for \( E[\Delta_3^2] \) given above, and \( \Delta_3 = \Delta_1 - \Delta_2 \),

\[
\left| \sum_{i < j < k < \ell} P_{ik} P_{jk} P_{i\ell} P_{j\ell} \right| \leq E \left[ \Delta_3^2 | Z \right] + O_{a.s.}(K) \leq E \left[ (\Delta_1 - \Delta_2)^2 | Z \right] + O_{a.s.}(K) \\
\leq 2 E \left[ \Delta_1^2 | Z \right] + 2 E \left[ \Delta_2^2 | Z \right] + O_{a.s.}(K) \leq O_{a.s.}(K). Q.E.D.
\]

**Lemma B3:** Let \( L \) be the lower triangular matrix with \( L_{ij} = P_{ij} 1(i > j) \). Then, under Assumption 2, \( \|LL'\| \leq C\sqrt{K} \) with probability one for \( n \) sufficiently large, where \( |A| = |\text{Tr}(AA')|^{1/2} \).

**Proof:** From the proof of Lemma B2 and by Lemma B1 and Lemma B2 b) we have for \( n \) sufficiently large

\[
\|LL'\|^2 = \text{tr}(LL'LL') = \sum_{i < j} P_{ij}^4 + 2 \sum_{i < j < k} (P_{ij}^2 P_{ik}^2 + P_{ik}^2 P_{jk}^2) + 4 \sum_{i < j < k < \ell} P_{ik} P_{kj} P_{i\ell} P_{j\ell} \\
\leq C(K + \sum_{i < j < k < \ell} P_{ik} P_{kj} P_{i\ell} P_{j\ell}) \leq CK \text{ a.s. } \mathbb{P}_Z.
\]

Taking square roots gives the answer. Q.E.D.

**Lemma B4:** Let \( A \) and \( B \) be \( n \times n \) matrices, and let \( K_{nm} \left( n^2 \times n^2 \right) \) denote a commutation matrix so that \( K_{nm} \text{vec}(A) = \text{vec}(A') \) Then,

\[
\text{tr} \left\{ (A \otimes B) K_{nm} \right\} = \text{tr} \left\{ AB \right\}.
\]

38
Proof: To proceed, first note that, \( K_{mn} \) has the explicit form

\[
K_{mn} = \left( I_n \otimes e_{1,n} : I_n \otimes e_{2,n} : \cdots : I_n \otimes e_{n,n} \right)',
\]

where \( e_{i,n} \) is the \( i \)th column of an \( n \times n \) identity matrix. Now, by direct calculation, we have that

\[
\text{tr} \{(A \otimes B) K_{mn}\} = \text{tr}\{K_{mn} (A \otimes B)\} = \text{tr}\left\{\begin{pmatrix} A \otimes e_{1,n}'B \\ A \otimes e_{2,n}'B \\ \vdots \\ A \otimes e_{n,n}'B \end{pmatrix}\right\} = \sum_{i=1}^{n} (e_{i,n}'A e_{1,n}) (e_{1,n}'B e_{i,n}) + \sum_{i=1}^{n} (e_{i,n}'A e_{2,n}) (e_{2,n}'B e_{i,n}) + \cdots + \sum_{i=1}^{n} (e_{i,n}'A e_{n,n}) (e_{n,n}'B e_{i,n}) = e_{1,n}'B \left( \sum_{i=1}^{n} e_{i,n} e_{i,n}' \right) A e_{1,n} + e_{2,n}'B \left( \sum_{i=1}^{n} e_{i,n} e_{i,n}' \right) A e_{2,n} + \cdots + e_{n,n}'B \left( \sum_{i=1}^{n} e_{i,n} e_{i,n}' \right) A e_{n,n} = \text{tr}\{BA\} = \text{tr}\{AB\}. \quad \text{Q.E.D.}
\]

For Lemma A5 below, let \( \phi_i(Z) (i = 1, \ldots, n) \) denote some sequence of measurable functions. In application of this lemma, we will take \( \phi_i(Z) \) to be either conditional variances or conditional covariances given \( Z \).

**Lemma B5:** Suppose that i) \( P \) is a symmetric, idempotent matrix with rank(\( P \)) = \( K \) and \( P_{ii} \leq C < 1; \) ii) \( (u_1, \varepsilon_1), \ldots, (u_n, \varepsilon_n) \) are independent conditional on \( Z; \) iii) there exists a constant \( C \) such that, with probability one, \( \sup_i E(\varepsilon_i^4 \mid Z) \leq C, \sup_i E(\varepsilon_i^2 \mid Z) \leq C, \) and \( \sup_i |\phi_i| = \sup_i |\phi_i(Z)| \leq C \). Then, with probability one,

a) \( E\left[ \left( \frac{1}{\pi} \sum_{1 \leq i < k \leq n} P_{ki}\phi_k(\varepsilon_i - \gamma_i) \right)^2 \mid Z \right] \to 0; \)

b) \( E\left[ \left( \frac{1}{\pi} \sum_{1 \leq i < j < k \leq n} P_{ki}P_{kj}\phi_k(\varepsilon_i + \varepsilon_j) \right)^2 \mid Z \right] \to 0; \)

c) \( E\left[ \left( \frac{1}{\pi} \sum_{1 \leq i < j < k \leq n} P_{ki}P_{kj}\phi_k(\varepsilon_i + \varepsilon_j) \right)^2 \mid Z \right] \to 0; \)

d) \( E\left[ \left( \frac{1}{\pi} \sum_{1 \leq i < j < k \leq n} P_{ki}P_{kj}\phi_k(\varepsilon_i + \varepsilon_j) \right)^2 \mid Z \right] \to 0. \)

Proof: To set some notation, let \( \sigma_i^2 = E[\varepsilon_i^2 \mid Z] \), \( \omega_i^2 = \omega_i^2(Z) = E[u_i^2 \mid Z] \), and \( \gamma_i = \gamma_i(Z) = E[u_i \varepsilon_i \mid Z] \), where in order to simplify notation, we suppress the dependence of \( \sigma_i^2 \) on \( Z \) and of \( \omega_i^2 \) and \( \gamma_i \) on \( Z \) and \( n \).
Now, to show part (a), note that

\[
E \left[ \left( \frac{1}{K} \sum_{1 \leq i < k \leq n} P_{ki}^2 \phi_k (u_i \varepsilon_i - \gamma_i) \right)^2 | Z \right]
\]

\[
= \frac{1}{K^2} \sum_{1 \leq i < k \leq n} P_{ki}^4 \phi_k^2 \left\{ E \left( u_i^2 \varepsilon_i^2 | Z \right) - \gamma_i^2 \right\}
\]

\[
+ \frac{2}{K^2} \sum_{1 \leq i < k \leq l \leq n} P_{kl}^2 P_{ki}^2 \phi_k \phi_l \left\{ E \left( u_i^2 \varepsilon_i^2 | Z \right) - \gamma_i^2 \right\}
\]

\[
\leq \frac{1}{K^2} \sum_{1 \leq i < k \leq n} P_{ki}^4 \phi_k^2 \left\{ \sqrt{E \left( u_i^4 | Z \right) E \left( \varepsilon_i^4 | Z \right)} + E \left( u_i^2 | Z \right) E \left( \varepsilon_i^2 | Z \right) \right\}
\]

\[
+ \frac{2}{K^2} \sum_{1 \leq i < k \leq l \leq n} P_{kl}^2 P_{ki}^2 | \phi_k | | \phi_l | \left\{ \sqrt{E \left( u_i^4 | Z \right) E \left( \varepsilon_i^4 | Z \right)} + E \left( u_i^2 | Z \right) E \left( \varepsilon_i^2 | Z \right) \right\}
\]

\[
\leq C \left\{ \frac{1}{K^2} \sum_{1 \leq i < k \leq n} P_{ki}^4 + \frac{2}{K^2} \sum_{1 \leq i < k \leq l \leq n} P_{kl}^2 P_{ki}^2 \right\} \rightarrow 0 \text{ a.s. } P_Z,
\]

where the first inequality is the result of applying T and a conditional version of CS, the second inequality follows by hypothesis, and the convergence to zero almost surely follows from applying Lemma B1 parts (a) and (b).

To show part (b), first let \( L \) be a lower triangular matrix with \((i, j)\)th element \( L_{ij} = P_{ij} 1(i > j) \) as in Lemma B3 above, and define \( D_{\gamma} = diag(\gamma_1, ..., \gamma_n), D_\phi = diag(\phi_1, ..., \phi_n), u = (u_1, ..., u_n)' \), and \( \varepsilon = (\varepsilon_1, ..., \varepsilon_n)' \). It then follows by direct multiplication that

\[
\varepsilon' L' D_\phi L u - tr \left\{ L' D_\phi L D_\gamma \right\} = \sum_{1 \leq i < k \leq n} P_{ki}^2 \phi_k (u_i \varepsilon_i - \gamma_i) + \sum_{1 \leq i < j < k \leq n} P_{ki} P_{kj} \phi_k (u_i \varepsilon_j + u_j \varepsilon_i),
\]

so that by making use of Løève’s \( c_r \) inequality, we have that

\[
\frac{1}{K^2} E \left[ \left( \sum_{1 \leq i < j < k \leq n} P_{ki} P_{kj} \phi_k (u_i \varepsilon_j + u_j \varepsilon_i) \right)^2 | Z \right]
\]

\[
\leq 2 \frac{1}{K^2} E \left[ (u' L' D_\phi L \varepsilon - tr \left\{ L' D_\phi L D_\gamma \right\})^2 | Z \right]
\]

\[
+ 2 \frac{1}{K^2} E \left[ \left( \sum_{1 \leq i < k \leq n} P_{ki}^2 \phi_k (u_i \varepsilon_i - \gamma_i) \right)^2 | Z \right]
\]

(2)

It has already been shown in the proof of part (a) that \( (1/K^2) E \left[ \left( \sum_{1 \leq i < k \leq n} P_{ki}^2 \phi_k (u_i \varepsilon_i - \gamma_i) \right)^2 | Z \right] \rightarrow 0 \text{ a.s. } P_Z \), so what remains to be shown is that \( (1/K^2) E \left[ (u' L' D_\phi L \varepsilon - tr \left\{ L' D_\phi L D_\gamma \right\})^2 | Z \right] \rightarrow 0 \text{ a.s. } P_Z. \)
$P_\Omega$. To show the latter, first note that

$$
\frac{1}{K^2} E \left[ \left( u' L' D_\phi L \varepsilon - \text{tr} \{ L' D_\phi L \gamma \} \right)^2 \mid Z \right] = \frac{1}{K^2} E \left[ (u' L' D_\phi L \varepsilon)^2 \mid Z \right] - \frac{1}{K^2} \left[ \text{tr} \{ L' D_\phi L \gamma \} \right]^2 \\
= \frac{1}{K^2} E \left[ u' L' D_\phi L \varepsilon \otimes u' L' D_\phi L \varepsilon \mid Z \right] - \frac{1}{K^2} \left[ \text{tr} \{ L' D_\phi L \gamma \} \right]^2 \\
= \frac{1}{K^2} \text{tr} \left\{ (u' \otimes u') \left( L' D_\phi L \otimes L' D_\phi L \right) (\varepsilon \otimes \varepsilon) \mid Z \right\} - \frac{1}{K^2} \left[ \text{tr} \{ L' D_\phi L \gamma \} \right]^2 \\
= \frac{1}{K^2} \text{tr} \left\{ (L' D_\phi L \otimes L' D_\phi L) E [\varepsilon u' \otimes \varepsilon u' \mid Z] \right\} - \frac{1}{K^2} \left[ \text{tr} \{ L' D_\phi L \gamma \} \right]^2. \quad (3)
$$

Next, note that, by straightforward calculation, we have

$$
E [\varepsilon u' \otimes \varepsilon u' \mid Z] = \begin{pmatrix}
\sigma^2 \omega^2_1 e_1 e'_1 \\
\sigma^2 \omega^2_2 e_2 e'_1 \\
\vdots \\
\sigma^2 \omega^2_n e_n e'_1 \\
\vartheta_1 e_1 e'_1 \\
0 \\
\vdots \\
0
\end{pmatrix}
+ \begin{pmatrix}
\gamma_1 \otimes D_\gamma \\
\gamma_2 \otimes D_\gamma \\
\vdots \\
\gamma_n \otimes D_\gamma \\
0 \\
0 \\
\vdots \\
0
\end{pmatrix}
+ \begin{pmatrix}
\sigma^2 \omega^2_1 e_1 e'_2 \\
\sigma^2 \omega^2_2 e_2 e'_2 \\
\vdots \\
\sigma^2 \omega^2_n e_n e'_2 \\
0 \\
0 \\
\vdots \\
0
\end{pmatrix}
+ \begin{pmatrix}
\vartheta_2 e_2 e'_2 \\
0 \\
\vdots \\
0 \\
0 \\
0 \\
\vdots \\
0
\end{pmatrix}
= \left( D_\sigma \otimes I_n \right) \text{vec} (I_n) \text{vec} (I_n) (D_\omega \otimes I_n) + \left( D_\gamma \otimes I_n \right) \mathbf{K}_{nn} \left( D_\gamma \otimes I_n \right) + \mathbf{E}' D_\phi \mathbf{E} + \left( D_\gamma \otimes D_\gamma \right) \quad (4)
$$

where \( \mathbf{K}_{nn} \) is an \( n^2 \times n^2 \) commutation matrix such that for any \( n \times n \) matrix \( A \), \( \mathbf{K}_{nn} \text{vec} (A) = \text{vec} (A') \). (See Magnus and Neudecker, 1988, pages 46-48 for more on commutation matrices.) Also, here, \( D_\gamma = \text{diag} (\gamma_1, \ldots, \gamma_n) \), \( D_\sigma = \text{diag} (\sigma_1^2, \ldots, \sigma_n^2) \), \( D_\omega = \text{diag} (\omega_1^2, \ldots, \omega_n^2) \), \( D_\theta = \text{diag} (\vartheta_1, \ldots, \vartheta_n) \) with \( \vartheta_i = E [\varepsilon_i^2 u_i^2 \mid Z] - \sigma^2_1 \omega^2_i - 2 \gamma_i^2 \) for \( i = 1, \ldots, n \), and \( \mathbf{E} = \left( e_1 \otimes e_1; e_2 \otimes e_2; \ldots; e_n \otimes e_n \right)' \); and \( e_i \) is the \( i \)th
column of an \( n \times n \) identity matrix. It follows from (3) and (4) that

\[
\frac{1}{K^2} E \left[ (u'L'D_\phi L \varepsilon - \text{tr} \{ L'D_\phi LD_\gamma \})^2 \mid Z \right] = \frac{1}{K^2} \text{tr} \left\{ \left( (L'D_\phi L \otimes L'D_\phi L) (D_\sigma \otimes I_n) \text{vec} (I_n) \text{vec}(I_n)' (D_\omega \otimes I_n) \right) \right\} \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) (D_\gamma \otimes I_n) K_{mn} (D_\gamma \otimes I_n) \right\} \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) E'D_\phi E \right\} + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) (D_\gamma \otimes D_\gamma) \right\} \\
\quad - \frac{1}{K^2} \left[ \text{tr} \left\{ L'D_\phi LD_\gamma \right\} \right]^2 = \frac{1}{K^2} \text{vec}(I_n)' (D_\omega L'D_\phi LD_\sigma \otimes L'D_\phi L) \text{vec}(I_n) + \frac{1}{K^2} \text{tr} \left\{ \left( D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L \right) K_{mn} \right\} \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) E'D_\phi E \right\} + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi LD_\gamma \otimes L'D_\phi LD_\gamma \right) \right\} \\
\quad - \frac{1}{K^2} \left[ \text{tr} \left\{ L'D_\phi LD_\gamma \right\} \right]^2 = \frac{1}{K^2} \text{tr} \left\{ L'D_\phi LD_\omega L'D_\phi LD_\sigma \right\} + \frac{1}{K^2} \text{tr} \left\{ \left( D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L \right) K_{mn} \right\} \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) E'D_\phi E \right\} \right. \\
\quad \left. + \frac{1}{K^2} \text{tr} \left\{ \left( D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L \right) K_{mn} \right\} \right) \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) E'D_\phi E \right\} \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L \right) K_{mn} \right\} \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi L \otimes L'D_\phi L \right) E'D_\phi E \right\} \right) \\
\quad + \frac{1}{K^2} \text{tr} \left\{ \left( D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L \right) K_{mn} \right\} = \frac{1}{K^2} \text{tr} \left\{ \left( L'D_\phi LD_\omega L'D_\phi LD_\sigma \right) \right\}
\]

(5)
Focusing first on the first term of (5), we get

\[
\frac{1}{K^2} tr \left\{ L'D_\phi LD_\omega L'D_\phi LD_\phi \right\} \\
\leq \sqrt{\frac{1}{K^2} tr \left\{ L'D_\phi LD_\omega^2 L'D_\phi L \right\}} \sqrt{\frac{1}{K^2} tr \left\{ L'D_\phi LD_\phi^2 L'D_\phi L \right\}} \\
\leq \sqrt{\max_{1 \leq i \leq n} \omega_i^4} \sqrt{\max_{1 \leq i \leq n} \sigma_i^4} \frac{1}{K^2} tr \left\{ L'D_\phi LL'D_\phi L \right\} \\
\leq \sqrt{\max_{1 \leq i \leq n} \omega_i^4} \sqrt{\max_{1 \leq i \leq n} \sigma_i^4} \sqrt{\frac{1}{K^2} tr \left\{ D_\phi LL'D_\phi^2 LL'D_\phi \right\}} \sqrt{\frac{1}{K^2} tr \left\{ LL'LL' \right\}} \\
\leq \sqrt{\max_{1 \leq i \leq n} \omega_i^4} \sqrt{\max_{1 \leq i \leq n} \sigma_i^4} \left( \max_{1 \leq i \leq n} \phi_i^2 \right) \frac{1}{K^2} tr \left\{ L'LL' \right\} \\
\leq \max_{1 \leq i \leq n} E \left( u_i^4 | Z \right) \sqrt{\frac{1}{K^2} tr \left\{ LL'LL' \right\}} \leq \frac{C}{K^2} tr \left\{ LL'LL' \right\} = \frac{C}{K^2} \| LL' \|^2 \quad \text{a.s. } \mathbb{P}_Z,
\]

where the first and third inequalities follow from CS; the second and fourth inequalities follow from the fact that let \( A \) be an \( n \times n \) matrix and \( \Lambda = \text{diag} (\lambda_1, ..., \lambda_n) \) such that \( \lambda_i \geq 0 \) for all \( i \), then,

\[
tr \left\{ A'A \right\} \leq \left( \max_{1 \leq i \leq n} \lambda_i \right) tr \left( A'A \right) ;
\]

the sixth inequality follows from the conditional version of the Jensen’s inequality and the last inequality follows in light of the assumptions of this lemma.

Turning our attention now to the second term of (5), we see that by Lemma B4

\[
\frac{1}{K^2} tr \left\{ (D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L) K_{nn} \right\} \\
= \frac{1}{K^2} tr \left\{ D_\gamma L'D_\phi LD_\gamma L'D_\phi L \right\} = \frac{1}{K^2} tr \left\{ L'D_\phi LD_\gamma L'D_\phi LD_\gamma \right\}.
\]

It follows by calculations similar to that used to obtain (6), we obtain

\[
\frac{1}{K^2} tr \left\{ (D_\gamma L'D_\phi LD_\gamma \otimes L'D_\phi L) K_{nn} \right\} \\
\leq \left( \max_{1 \leq i \leq n} \gamma_i^2 \right) \left( \max_{1 \leq i \leq n} \phi_i^2 \right) \frac{1}{K^2} tr \left\{ LL'LL' \right\} \leq C \frac{1}{K^2} tr \left\{ LL'LL' \right\} = \frac{C}{K^2} \| LL' \|^2 \quad \text{a.s. } \mathbb{P}_Z.
\]

43
Finally, to analyze the third term of (5), we note that
\[
\frac{1}{K^2} \left| \text{tr} \left\{ (L'D_\phi L \otimes L'D_\phi L) E'D_\phi E \right\} \right| \\
\leq \frac{1}{K^2} \sum_{i=1}^{n} |\vartheta_i| \text{tr} \left\{ e_i'L'D_\phi L e_i L'D_\phi L e_i e_i' \right\} = \frac{1}{K^2} \sum_{i=1}^{n} |\vartheta_i| (e_i'L'D_\phi L e_i)^2 \\
\leq \frac{1}{K^2} \sum_{i=1}^{n} |\vartheta_i| (e_i'L'D_\phi^2 L e_i) (e_i'L' L e_i) \leq \left( \max_{1 \leq i \leq n} \phi_i^2 \right) \frac{1}{K^2} \sum_{i=1}^{n} |\vartheta_i| (e_i'L' L e_i)^2 \\
\leq \left\{ \sqrt{E [e_i^4 \mid Z]} \sqrt{E [u_i^4 \mid Z]} \right\} + \left( \max_{1 \leq i \leq n} \sigma_i^2 \right) \left( \max_{1 \leq i \leq n} \omega_i^2 \right) + 2 \left( \max_{1 \leq i \leq n} \gamma_i^2 \right) \\
\times \left( \max_{1 \leq i \leq n} \phi_i^2 \right) \frac{1}{K^2} \sum_{i=1}^{n} (e_i'L' L e_i)^2 \\
\leq C \frac{1}{K^2} \sum_{i=1}^{n} (e_i'L' L e_i)^2 \leq C \frac{1}{K^2} \sum_{i=1}^{n} (e_i'P' P e_i)^2 = C \frac{1}{K^2} \sum_{i=1}^{n} (e_i' P e_i)^2 = C \frac{1}{K^2} \sum_{i=1}^{n} P_{ii}^2 \\
\leq C \frac{1}{K^2} \sum_{i=1}^{n} P_{ii} = C (1/K) \text{ a.s. } \mathbb{P}_Z,
\]
where the first inequality above follows from T, the second inequality follows from CS, the third inequality makes use of (7), the fourth inequality uses CS and T, the fifth inequality follows as a consequence of the assumptions of this lemma, and the last inequality holds since $P_{ii} < 1$.

In light of (5), it follows from (6), (8), (9), and Lemma B3 that
\[
\frac{1}{K^2} E \left[ (u_i'L'D_\phi L \varepsilon - \text{tr} \left\{ L'D_\phi L \varepsilon \right\})^2 \mid Z \right] \leq 2C (1/K^2) \| LL' \|^2 + C (1/K) \leq C/K \text{ a.s. } \mathbb{P}_Z;
\]
which shows part (b).

It is easily seen that parts (c) and (d) can be proved in essentially the same way as part (b) (by taking $u_i = \varepsilon_i$); hence, to avoid redundancy, we do not give detailed arguments for these parts. Q.E.D.

Proof of Lemma A2: Let $b_{1n} = c_{1n} \Xi_n^{-1/2}$ and $b_{2n} = c_{2n} \Xi_n^{-1/2}$, and note that these are bounded in $n$ since $\Xi_n$ is bounded away from zero by hypothesis. Let $w_{in} = b_{1n}' W_{in}$ and $u_i = b_{2n}' U_i$, where we suppress the $n$ subscript on $u_i$ for notational convenience. Then
\[
Y_n = w_{1n} + \sum_{i=2}^{n} y_{in}, y_{in} = w_{in} + \bar{y}_{in}, \bar{y}_{in} = \sum_{j<i} (u_j P_{ij} \varepsilon_i + u_i P_{ij} \varepsilon_j) / \sqrt{K}.
\]
Also, $E \left[ \| w_{1n} \|^4 \mid Z \right] \leq \sum_i E \left[ \| w_{in} \|^4 \mid Z \right] \leq C \sum_i E \left[ \| W_{in} \|^4 \mid Z \right] \rightarrow 0 \text{ a.s. } \mathbb{P}_Z$; so that, by a conditional version of M, we deduce that for any $v > 0$
\[
P \left( \| w_{1n} \| \geq v \mid Z \right) \rightarrow 0 \text{ a.s. } \mathbb{P}_Z.
\]
Moreover, note that \( \sup_n E \left[ |P (|w_{1n}| \geq v \mid Z)|^2 \right] < \infty \). It follows that, by Theorem 25.12 of Billingsley (1986)
\[
P \left( |w_{1n}| \geq v \right) = E \left[ P (|w_{1n}| \geq v \mid Z) \right] \rightarrow 0 \text{ as } n \rightarrow \infty;
\]
that is, \( w_{1n} \overset{p}{\rightarrow} 0 \) unconditionally. Hence,
\[
Y_n = \sum_{i=2}^{n} y_{in} + o_p(1).
\]

Now, we will show that \( Y_n \overset{d}{\rightarrow} N (0,1) \) by first showing that, conditional on \( Z \),
\[
\sum_{i=2}^{n} y_{in} \overset{d}{\rightarrow} N (0,1),
\]
with probability one. To proceed, let \( X_i = (W_{in}^I, U_i, \varepsilon_i)^t \) for \( i = 1, \ldots, n \). Define the \( \sigma \)-fields \( F_{i,n} = \sigma (X_1, \ldots, X_i) \) for \( i = 1, \ldots, n \). Note that, by construction, \( F_{i-1,n} \subseteq F_{i,n} \). Moreover, it is straightforward to verify that, conditional on \( Z \), \( \{y_{in}, F_{i,n}, 1 \leq i \leq n, n \geq 2 \} \) is a martingale difference array, and we can apply the martingale central limit theorem. Moreover, as before, let \( \sigma_i^2 = E[\varepsilon_i^2 | Z], \quad \omega_i^2 = \omega_{in}^2 (Z) = E[u_i^2 | Z] \), and \( \gamma_i = \gamma_{in} (Z) = E[u_i \varepsilon_i | Z] \), where in order to simplify notation, we suppress the dependence of \( \sigma_i^2 \) on \( Z \) and of \( \omega_i^2 \) and \( \gamma_i \) on \( Z \) and \( n \). Now, note that \( E[w_{in} \bar{y}_{jn} | Z] = 0 \), for all \( i \) and \( j \) and that
\[
E \left[ (\bar{y}_{in})^2 \mid Z \right] = \sum_{j<i} \sum_{k<i} E \left[ (u_j P_{ij} \varepsilon_i + u_i P_{ij} \varepsilon_j) (u_k P_{ik} \varepsilon_i + u_i P_{ik} \varepsilon_k) \mid Z \right] / K
\]
\[
= \sum_{j<i} P_{ij}^2 \left[ \omega_j^2 \sigma_i^2 + \omega_i^2 \sigma_j^2 + 2 \gamma_i \gamma_j \right] / K.
\]
Thus,
\[
s_n^2 (Z) = E \left[ \left( \sum_{i=2}^{n} y_{in} \right)^2 \mid Z \right] = \sum_{i=2}^{n} \left( E \left[ y_{in}^2 \mid Z \right] + E \left[ \bar{y}_{in}^2 \mid Z \right] \right)
\]
\[
= b_{1n}' D_n (Z) b_{1n} - E \left[ y_{in}^2 \mid Z \right] + \sum_{i \neq j} P_{ij}^2 \left[ \omega_j^2 \sigma_i^2 + \omega_i^2 \sigma_j^2 + 2 \gamma_i \gamma_j \right] / K
\]
\[
= b_{1n}' D_n (Z) b_{1n} + b_{2n}' \bar{\Sigma}_n (Z) b_{2n} + o_{a.s.}(1) = 1 + o_{a.s.}(1) \rightarrow 1 \text{ a.s.}
\]
Thus, \( s_n^2 (Z) \) is bounded and bounded away from zero with probability one. Also,
\[
\sum_{i=2}^{n} E \left[ y_{in}^4 \mid Z \right] \leq C \sum_{i=2}^{n} E \left[ |W_{in}|^4 \mid Z \right] + C \sum_{i=2}^{n} E \left[ y_{in}^4 \mid Z \right].
\]
By condition iv), \(\sum_{i=2}^{n} E \left[ \|W_{in}\|^4 \mid Z \right] \rightarrow 0\). Let \(\bar{y}_{in} = \sum_{j<i} u_j P_{ij} \varepsilon_i / \sqrt{n}\) and \(\bar{y}_{in}^u = \sum_{j<i} u_i P_{ij} \varepsilon_j / \sqrt{K}\).

By \(|P_{ij}| < 1\) and \(\sum_j P_{ij}^2 = P_{ii}\), we have that with probability one

\[
\sum_{i=2}^{n} E \left[ (\bar{y}_{in})^4 \mid Z \right] \leq \frac{C}{K^2} \sum_{i=2}^{n} \sum_{j,k,l,m<i} P_{ij} P_{ik} P_{il} P_{im} E \left[ \varepsilon_i^4 \mid Z \right] E \left[ u_j u_k u_m \mid Z \right]
\]

\[
\leq \frac{C}{K^2} \sum_{i=2}^{n} \left( \sum_{j<i} P_{ij}^2 + \sum_{j<k<i} P_{ij}^2 P_{ik}^2 \right) \leq CK/K^2 \rightarrow 0.
\]

Similarly, \(\sum_{i=2}^{n} E \left[ (\bar{y}_{in}^u)^4 \mid Z \right] \rightarrow 0\) with probability one, so that

\[
\sum_{i=2}^{n} E \left[ \bar{y}_{in}^4 \mid Z \right] \leq C \sum_{i=2}^{n} \left\{ E \left[ (\bar{y}_{in}^u)^4 \mid Z \right] + E \left[ (\bar{y}_{in})^4 \mid Z \right] \right\} \rightarrow 0 \text{ a.s. } P_Z
\]

Then by T we have

\[
\sum_{i=2}^{n} E \left[ \bar{y}_{in}^4 \mid Z \right] \rightarrow 0 \text{ a.s.}
\]

Conditional on \(Z\), to apply the martingale central limit theorem, it suffices to show that for any \(\epsilon > 0\)

\[
P \left( \left| \sum_{i=2}^{n} E \left[ \bar{y}_{in}^2 \mid X_1, \ldots, X_{i-1}, Z \right] - s_n^2 (Z) \right| \geq \epsilon \mid Z \right) \rightarrow 0 \text{ a.s. } P_Z.
\]

(10)

Now, note that \(E \left[ w_{in} \bar{y}_{in} \mid Z \right] = 0 \text{ a.s.}\) and, thus, we can write

\[
\sum_{i=2}^{n} E \left[ \bar{y}_{in}^2 \mid X_1, \ldots, X_{i-1}, Z \right] - s_n^2 (Z)
\]

\[
= \sum_{i=2}^{n} \left( E[\bar{y}_{in}^2 \mid X_1, \ldots, X_{i-1}, Z] - E[\bar{y}_{in}^2 \mid Z] \right) + \sum_{i=2}^{n} E \left[ w_{in} \bar{y}_{in} \mid X_1, \ldots, X_{i-1}, Z \right]
\]

\[
+ \sum_{i=2}^{n} \left( E[\bar{y}_{in}^2 \mid X_1, \ldots, X_{i-1}, Z] - E[\bar{y}_{in}^2 \mid Z] \right)
\]

(11)

We will show that each term on the right-hand side of (11) converges to zero with probability one. To proceed, note first that by independence of \(W_{1n}, \ldots, W_{nn}\) conditional on \(Z\),

\[
E[\bar{y}_{in}^2 \mid X_1, \ldots, X_{i-1}, Z] = E[\bar{y}_{in}^2 \mid Z] \text{ a.s. } P_Z.
\]

Next, note that

\[
E \left[ w_{in} \bar{y}_{in} \mid X_1, \ldots, X_{i-1}, Z \right] = E \left[ w_{in} u_i \mid Z \right] \sum_{j<i} P_{ij} \varepsilon_j / \sqrt{K} + E \left[ w_{in} \varepsilon_i \mid Z \right] \sum_{j<i} P_{ij} u_j / \sqrt{K}.
\]

46
Let $\delta_i = E[w_{in}u_i | Z]$ and consider the first term, $\delta_i \sum_{j<i} P_{ij} \varepsilon_j / \sqrt{K}$. Let $\tilde{P}$ be the upper triangular matrix with $\tilde{P}_{ij} = P_{ij}$ for $j > i$ and $\tilde{P}_{ij} = 0$, $j \leq i$, and let $\delta = (\delta_1, \ldots, \delta_n)$. Then, $\sum_{i=2}^{n} \sum_{j<i} \delta_i P_{ij} \varepsilon_j / \sqrt{K} = \delta' \tilde{P}' \varepsilon / \sqrt{K}$.

By CS $\delta' \tilde{P}' = \sum_{i=1}^{n} (E[w_{in}u_i | Z])^2 \leq \sum_{i=1}^{n} E[w_{in}^2 | Z] E[u_i^2 | Z] \leq C$ with probability one. By Lemma B3, $\| \tilde{P}' \tilde{P} \| \leq \sqrt{K}$ with probability one, which in turn implies that $\lambda_{\max}(\tilde{P}' \tilde{P}) \leq \sqrt{K}$ with probability one. It then follows given $E[u_j^2 | Z] \leq C$ a.s. that

$$E[(\delta' \tilde{P}' \varepsilon / \sqrt{K})^2 | Z] \leq C \delta' \tilde{P}' \delta / K \leq C \|\delta\|^2 / \sqrt{K} \rightarrow 0 \text{ a.s. } P_Z,$$

so that by M we have that, for any $\epsilon > 0$,

$$P \left( \left. \delta (\tilde{Z})' \tilde{P}' \varepsilon / \sqrt{K} \right| \geq \epsilon | Z \right) \rightarrow 0 \text{ a.s. } P_Z.$$ 

Similarly, we have $\sum_{i=1}^{n} \sum_{j<i} E[w_{in}u_i | Z] P_{ij} \varepsilon_j / \sqrt{K} \rightarrow 0 \text{ a.s. } P_Z$. Therefore, it follows by T that, for any $\epsilon > 0$,

$$P \left( \left. \sum_{i=2}^{n} E[w_{in}y_{in} | X_1, \ldots, X_i-1, Z] \right| \geq \epsilon | Z \right) \rightarrow 0 \text{ a.s. } P_Z.$$

To finish showing that eq. (10) is satisfied it only remains to show that, for any $\epsilon > 0$,

$$P \left( \left. \sum_{i=2}^{n} (E[y_{in}^2 | X_1, \ldots, X_i-1, Z] - E[y_{in}^2 | Z]) \right| \geq \epsilon | Z \right) \rightarrow 0 \text{ a.s. } P_Z. \quad (12)$$

Now, write

$$\sum_{i=2}^{n} (E[y_{in}^2 | X_1, \ldots, X_i-1, Z] - E[y_{in}^2 | Z])$$

$$= \sum_{j<i} \omega_i^2 P_{ij} (\varepsilon_j^2 - \sigma_j^2) / K + 2 \sum_{j<k<i} \omega_i^2 P_{ij} P_{ik} \varepsilon_j \varepsilon_k / K$$

$$+ \sum_{j<i} \sigma_i^2 P_{ij}^2 (u_j^2 - \omega_j^2) / K + 2 \sum_{j<k<i} \sigma_i^2 P_{ij} P_{ik} u_j u_k / K$$

$$+ \sum_{j<i} \gamma_i P_{ij}^2 (u_j \varepsilon_j - \gamma_j) / K + 2 \sum_{j<k<i} \gamma_i P_{ij} P_{ik} (u_j \varepsilon_k + u_k \varepsilon_j) / K.$$

By applying part (a) of Lemma B5 with $\phi_i = \gamma_i$, $\omega_i^2$, and then $\sigma_i^2$ in succession; we obtain, with probability one, that

$$E \left[ \left( \sum_{j<i} \gamma_i P_{ij}^2 [u_j \varepsilon_j - \gamma_j] / K \right)^2 \bigg| Z \right] \rightarrow 0,$$

$$E \left[ \left( \sum_{j<i} \omega_i^2 P_{ij}^2 [\varepsilon_j^2 - \sigma_j^2] / K \right)^2 \bigg| Z \right] \rightarrow 0,$$

$$E \left[ \left( \sum_{j<i} \sigma_i^2 P_{ij}^2 [u_j^2 - \omega_j^2] / K \right)^2 \bigg| Z \right] \rightarrow 0.$$
Moreover, applying part (b) of Lemma B5 with \( \phi_i = \gamma_i \), we obtain

\[
E \left[ \left( \sum_{j<k<i} \gamma_i P_{ij} P_{ik} [u_j \varepsilon_k + u_k \varepsilon_i] / K \right)^2 \mid \mathcal{Z} \right] \to 0 \quad \text{a.s. } \mathbb{P}_\mathcal{Z}.
\]

Similarly, conditional on \( \mathcal{Z} \), all of the remaining terms in eq. (13) converge in mean square to zero with probability one by parts (c) and (d) of Lemma B5.

The above argument shows that as \( n \to \infty \)

\[
P( Y_n \leq y \mid \mathcal{Z} ) \to \Phi(y) \quad \text{a.s. } \mathbb{P}_\mathcal{Z},
\]

for every real number \( y \), where \( \Phi(y) \) denotes the cdf of a standard normal distribution. Moreover, it is clear that, for some \( \epsilon > 0 \),

\[
\sup_n E \left[ |P( Y_n \leq y \mid \mathcal{Z})|^{1+\epsilon} \right] < \infty,
\]

(take, for example, \( \epsilon = 1 \)). Hence, by a version of the dominated convergence theorem, as given by Theorem 25.12 of Billingsley (1986), we deduce that

\[
P( Y_n \leq y ) = E [P( Y_n \leq y \mid \mathcal{Z})] \to E[\Phi(y)] = \Phi(y),
\]

which gives the desired conclusion. Q.E.D.

**Proof of Lemma A4:** Let \( \bar{w}_i, \bar{W}_i, \bar{y}_i, \bar{Y}_i, \bar{\eta}_i, \bar{\mu}_W, \bar{\mu}_Y, \bar{\sigma}_W^2, \bar{\sigma}_Y^2, \) and \( \bar{\sigma}_\eta^2 \) are as defined at the beginning of Appendix A; and note that, in order to simplify notation, we have suppressed the dependence of these quantities on \( \mathcal{Z} \). Also, let

\[
\bar{y}_i = \sum_j P_{ij} \bar{y}_j, \quad \bar{w}_i = \sum_j P_{ij} \bar{w}_j,
\]

be predicted values from projecting \( \bar{y} = (\bar{y}_1, \ldots, \bar{y}_n)' \) and \( \bar{w} = (\bar{w}_1, \ldots, \bar{w}_n)' \) on the column space of \( \mathcal{Z} \). Now, define \( \epsilon_{k,n} \) to be the \( k^{th} \) column of an \( n \times n \) identity matrix, and we can write \( \bar{w}_k = \epsilon_{k,n}' P \bar{w} \) and \( \bar{y}_k = \epsilon_{k,n}' P \bar{y} \). Note that

\[
\begin{align*}
\sum_i \bar{y}_i^2 &= \bar{y}' \epsilon' \sum_k \epsilon_{k,n} \epsilon_{k,n}' P \bar{y} = \bar{y}' \epsilon' P \bar{y} = \bar{y}' P \bar{y} \leq \bar{y}' \bar{y} = \sum_i \bar{y}_i^2, \\
\sum_i \bar{w}_i^2 &= \bar{w}' \epsilon' \sum_k \epsilon_{k,n} \epsilon_{k,n}' P \bar{w} = \bar{w}' \epsilon' P \bar{w} = \bar{w}' P \bar{w} \leq \bar{w}' \bar{w} = \sum_i \bar{w}_i^2.
\end{align*}
\]

(13)

(14)

By independent observations conditional on \( \mathcal{Z} \), we have

\[
A_n = \sum_{i < j} \sum_{k \notin \{i,j\}} \bar{w}_i P_{ik} \bar{\eta}_k P_{kj} \bar{y}_j = \sum_{i < j} \sum_k \bar{w}_i P_{ik} \bar{\eta}_k P_{kj} \bar{y}_j - \sum_{i < j} \bar{w}_i P_{ii} \bar{\eta}_i P_{ij} \bar{y}_j - \sum_{i < j} \bar{w}_i P_{ij} \bar{\eta}_j P_{jj} \bar{y}_j
\]

\[
= \sum_k \bar{w}_k \bar{\eta}_k \bar{y}_k - \sum_{i,k} \bar{w}_i \bar{y}_i P_{ik}^2 \bar{\eta}_k - \sum_i \bar{w}_i P_{ii} \bar{\eta}_i \bar{y}_i - \sum_i \bar{w}_i P_{ii} \bar{\eta}_i \bar{\eta}_i + 2 \sum_i \bar{w}_i \bar{y}_i P_{ii}^2 \bar{\eta}_i.
\]

48
To show that $A_n = O_p(1)$, it suffices to show that there exists a positive constant $C$ such that $E[|A_n|] \leq C < \infty$ for $n$ sufficiently large. To proceed, note first that

$$
E_Z \left[ \sum_k \tilde{w}_k \tilde{\eta}_k \tilde{y}_k \right] \leq E_Z \left[ \sum_k \tilde{\eta}_k P e_{k,n} \epsilon'_{k,n} \bar{P} \bar{y} \right]
$$

$$
\leq E_Z \left[ \sqrt{\sum_k \tilde{w}_k^2 P e_{k,n} \epsilon'_{k,n} \bar{P} \sqrt{\sum_k \tilde{\eta}_k^2 \bar{y}^2 e_{k,n} \epsilon'_{k,n} \bar{P} \bar{y}}} \right] \leq E_Z \left[ \max_{1 \leq k \leq n} |\tilde{\eta}_k| \sqrt{\tilde{w}_k^2 \tilde{\eta}_k} \right] \leq C,
$$

where the first inequality follows from CS, the third inequality follows from (13) and (14), the fourth inequality follows from inequality $2E|XY| \leq E(X^2) + E(Y^2)$, and the last inequality follows by hypothesis. In a similar manner, we have that

$$
E_Z \left[ \sum_i \tilde{w}_i P_{ii} \tilde{\eta}_i \tilde{y}_i \right] \leq E_Z \left[ \sqrt{\sum_i \tilde{w}_i^2 P_{ii}^2 \tilde{\eta}_i \tilde{y}_i} \right] \leq \frac{1}{2} E_Z \left[ \tilde{\mu}_\eta^2 \right] + \frac{1}{2} E_Z \left[ \sum_i \tilde{w}_i^2 \sum_j \tilde{y}_j^2 \right] \leq C,
$$

and $E \left[ \sum_i \tilde{w}_i P_{ii} \tilde{\eta}_i \tilde{y}_i \right]$ is bounded in the same way as well. Moreover, using Lemma B1 and the inequality $2E|XY| \leq E(X^2) + E(Y^2)$, we obtain

$$
E_Z \left[ \sum_{i,k} \tilde{w}_i \tilde{y}_i P_{ik}^2 \tilde{\eta}_k \right] \leq E_Z \left[ \sum_{i,k} |\tilde{w}_i \tilde{y}_i P_{ik}^2 \tilde{\eta}_k| \right] \leq E_Z \left[ \tilde{\mu}_W \tilde{\mu}_Y \tilde{\mu}_\eta \sum_{i,k} P_{ik}^2 \right]
$$

$$
= KE_Z \left[ \tilde{\mu}_W \tilde{\mu}_Y \tilde{\mu}_\eta \right] = KE_Z \left[ \tilde{\mu}_W \sqrt{K} \tilde{\mu}_Y \sqrt{K} \tilde{\mu}_\eta \right] \leq \frac{1}{2} E_Z \left[ \tilde{\mu}_\eta^2 \right] + \frac{1}{4} K^2 E Z \left[ \tilde{\mu}_W^4 \right] + \frac{1}{4} K^2 E Z \left[ \tilde{\mu}_Y^4 \right] \leq C.
$$

Also, by similar argument, $E \left[ \sum_i \tilde{w}_i \tilde{y}_i P_{ii}^2 \tilde{\eta}_i \right] \leq C$. Thus, $E \left[ |A_n| \right] \leq C$ holds by T, from which it then follows by M that $A_n = O_p(1)$.

Next, note that

$$
W_i P_{ik} \eta_k P_{kj} Y_j
$$

$$
= \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} Y_j + \tilde{w}_i P_{ik} \tilde{\eta}_k P_{kj} Y_j
$$

$$
= \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} Y_j + \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} Y_j + \tilde{w}_i P_{ik} \tilde{\eta}_k P_{kj} Y_j
$$

$$
= \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{W}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j
$$

$$
+ \tilde{w}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{w}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{w}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j + \tilde{w}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{Y}_j.
$$
Similarly, by CS,

\[ \sum_{i \neq j \neq k} W_i P_{ik} \eta_k P_{kj} Y_j - A_n = \sum_{r=1}^{7} \hat{\psi}_r, \]

wherer

\[ \hat{\psi}_1 = \sum_{i \neq j \neq k} \hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \hat{Y}_j, \hat{\psi}_2 = \sum_{i \neq j \neq k} \hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{y}_j, \hat{\psi}_3 = \sum_{i \neq j \neq k} \hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j, \]

\[ \hat{\psi}_4 = \sum_{i \neq j \neq k} \hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{y}_j, \hat{\psi}_5 = \sum_{i \neq j \neq k} \hat{w}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j, \hat{\psi}_6 = \sum_{i \neq j \neq k} \hat{w}_i P_{ik} \hat{\eta}_k P_{kj} \bar{y}_j, \]

and \( \hat{\psi}_7 = \sum_{i \neq j \neq k} \hat{w}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j \). By T the second conclusion will follow from \( \hat{\psi}_r \xrightarrow{P} 0 \), \( r = 1, ..., 7 \).

Also, note that \( \hat{\psi}_7 \) is the same as \( \hat{\psi}_4 \) and \( \hat{\psi}_5 \) is the same as \( \hat{\psi}_2 \) with the random variables \( W \) and \( Y \) interchanged. Since the conditions on \( W \) and \( Y \) are symmetric it suffices to show that \( \hat{\psi}_r \xrightarrow{P} 0 \), \( r \in \{1, 2, 3, 4, 6\} \).

Consider now \( \hat{\psi}_1 \). Note that for \( i \neq j \neq k \) and \( r \neq s \neq t \) we have \( E[\hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j \bar{Y}_t \bar{y}_s \bar{y}_r \bar{y}_t \bar{y}_r \bar{Y}_j \bar{Y}_t] = 0 \) except when the each of the three indices \( i, j, k \) is equal to one of the three indices \( r, s, t \). There are six ways this can happen leading to six terms in

\[ E[\hat{\psi}_1^2] = \sum_{i \neq j \neq k} \sum_{r \neq s \neq t} E[\hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j \bar{Y}_t \bar{y}_s \bar{y}_r \bar{y}_t \bar{y}_r \bar{Y}_j \bar{Y}_t] = \sum_{q=1}^{6} \hat{\tau}_q. \]

Note that by hypothesis,

\[ KE_Z \left[ \sigma_W^2 \sigma_\eta^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) E_Z \left[ \sigma_\eta^2 \right] \leq C \left( K/r_n^2 \right) \to 0. \]

By Lemma B1, we have

\[ |\hat{\tau}_1| = \sum_{i \neq j \neq k} E[(\hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j)^2] = E_Z \left( \sum_{i \neq j \neq k} E[\hat{W}_i^2 | Z] P_{ik}^2 E[\eta_k^2 | Z] P_{kj}^2 E[\bar{Y}_j^2 | Z] \right) \leq KE_Z \left[ \sigma_W^2 \sigma_\eta^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) \to 0. \]

Similarly, by CS,

\[ |\hat{\tau}_3| = \left| \sum_{i \neq j \neq k} E[(\hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \bar{Y}_j)(\hat{W}_j P_{jk} \hat{\eta}_k P_{ki} \bar{Y}_i)] \right| \leq E_Z \left( \sum_{i \neq j \neq k} \left| E[\hat{W}_i \bar{Y}_i | Z] \right| \left| E[\bar{Y}_j \bar{Y}_j | Z] \right| E[\eta_k^2 | Z] P_{ik}^2 P_{kj}^2 \right) \leq KE_Z \left[ \sigma_W^2 \sigma_\eta^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) \to 0. \]
Next, by Lemma B1 and CS

\[
|\hat{\tau}_2| = \left| \sum_{i \neq j \neq k} E[(\tilde{W}_i P_{ik} \tilde{n}_k P_{kj} \tilde{Y}_j)(\tilde{W}_i P_{ij} \tilde{n}_j P_{jk} \tilde{Y}_k)] \right|
\]

\[
\leq E_Z \left( \sum_{i \neq j \neq k} E[\tilde{W}_i^2 | \tilde{Z}] \left| E[\tilde{n}_k \tilde{Y}_k | \tilde{Z}] \right| E[\tilde{n}_j \tilde{Y}_j | \tilde{Z}] \left| P_{ik} P_{ij} P_{jk}^2 \right] \right)
\]

\[
\leq K E_Z \left[ \sigma_W^2 \sigma_n^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) \rightarrow 0.
\]

Similarly,

\[
|\hat{\tau}_4| = \left| \sum_{i \neq j \neq k} E[(\tilde{W}_i P_{ik} \tilde{n}_k P_{kj} \tilde{Y}_j)(\tilde{W}_j P_{ji} \tilde{n}_i P_{ik} \tilde{Y}_i)] \right|
\]

\[
= E_Z \left( \sum_{i \neq j \neq k} \left| E[\tilde{W}_i \tilde{n}_k | \tilde{Z}] \left| E[\tilde{W}_j \tilde{Y}_j | \tilde{Z}] \left| E[\tilde{n}_k \tilde{Y}_k | \tilde{Z}] \left| P_{ik}^2 P_{ij} P_{ji} \right] \right. \right| \right)
\]

\[
\leq K E_Z \left[ \sigma_W^2 \sigma_n^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) \rightarrow 0,
\]

\[
|\hat{\tau}_5| = \left| \sum_{i \neq j \neq k} E[(\tilde{W}_i P_{ik} \tilde{n}_k P_{kj} \tilde{Y}_j)(\tilde{W}_k P_{ki} \tilde{n}_i P_{ij} \tilde{Y}_i)] \right|
\]

\[
= E_Z \left( \sum_{i \neq j \neq k} \left| E[\tilde{W}_i \tilde{n}_k | \tilde{Z}] \left| E[\tilde{W}_k \tilde{n}_k | \tilde{Z}] \left| E[\tilde{W}_k \tilde{Y}_k | \tilde{Z}] \left| P_{ik}^2 P_{kj} P_{ji} \right] \right. \right| \right)
\]

\[
\leq K E_Z \left[ \sigma_W^2 \sigma_n^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) \rightarrow 0,
\]

\[
|\hat{\tau}_6| = \left| \sum_{i \neq j \neq k} E[(\tilde{W}_i P_{ik} \tilde{n}_k P_{kj} \tilde{Y}_j)(\tilde{W}_k P_{kj} \tilde{n}_j P_{ji} \tilde{Y}_i)] \right|
\]

\[
= E_Z \left( \sum_{i \neq j \neq k} \left| E[\tilde{W}_i \tilde{Y}_j | \tilde{Z}] \left| E[\tilde{n}_j \tilde{Y}_j | \tilde{Z}] \left| E[\tilde{W}_k \tilde{n}_k | \tilde{Z}] \left| P_{jk}^2 P_{ij} P_{ik} \right] \right. \right| \right)
\]

\[
\leq K E_Z \left[ \sigma_W^2 \sigma_n^2 \sigma_Y^2 \right] \leq C \left( K/r_n^2 \right) \rightarrow 0.
\]

The triangle inequality then gives $E[\hat{\psi}_2^2] \rightarrow 0$, so $\hat{\psi}_2^2 \xrightarrow{p} 0$ holds by M.

Consider now $\hat{\psi}_2$. Note that for $i \neq j \neq k$ and $r \neq s \neq t$ we have $E[\tilde{W}_i P_{ik} \tilde{n}_k P_{kj} \tilde{Y}_j \tilde{W}_r P_{rs} \tilde{n}_s P_{st} \tilde{Y}_t] = 0$ except when $i = r$ and $j = s$ or $i = s$ and $j = r$. Then by $(A + B + C)^2 \leq 3(A^2 + B^2 + C^2)$ and for
fixed $k$, $\sum_{i \neq k} P_{ik}^2 \leq P_{kk}$, $\sum_{i \neq k} P_{ik}^4 \leq P_{kk}$, it follows that

$$E_Z \left\{ \left[ \sum_{i \neq k} P_{ik}^2 \left( \sum_{j \notin \{i,k\}} P_{kj} \bar{y}_j \right) \right]^2 \right\}$$

$$\leq 9E_Z \left\{ \left[ \sum_{i \neq k} P_{ik}^2 (\bar{y}_k^2 + P_{ki}^2 \bar{y}_i^2 + P_{kk}^2 \bar{y}_k^2) \right]^2 \right\}$$

$$\leq 9E_Z \left( \sum_k P_{kk} (\bar{y}_k^2 + 2 \bar{y}_k^2) \right)^2 \leq 9E_Z \left( \sum_k \bar{y}_k^2 + 2 \sum_k \bar{y}_k^2 \right)^2 \leq 81E_Z \left[ \left( \sum_k \bar{y}_k^2 \right)^2 \right] \leq C.$$  

It follows by $|AB| \leq (A^2 + B^2)/2$, CS, and $P_{ik} = P_{ki}$ that

$$E[\hat{\psi}_2] = E_Z \left\{ \sum_{i \neq k} E[\hat{W}_i^2 | Z] P_{ik} E[\hat{\eta}_k^2 | Z] \left( \sum_{j \notin \{i,k\}} P_{kj} \bar{y}_j \right)^2 \right\}$$

$$+ \sum_{i \neq k} E[\hat{W}_i \hat{\eta}_i | Z] P_{ik} E[\hat{W}_k \hat{\eta}_k | Z] \left( \sum_{j \notin \{i,k\}} P_{kj} \bar{y}_j \right) \left( \sum_{j \notin \{i,k\}} P_{ij} \bar{y}_j \right) \right\}$$

$$\leq 2E_Z \left[ \sigma^2 \tilde{W} \sigma^2 \sum_{i \neq k} P_{ik}^2 \left( \sum_{j \notin \{i,k\}} P_{kj} \bar{y}_j \right)^2 \right]$$

$$\leq \frac{C}{r_n} \left\{ \sqrt{E_Z [\hat{\eta}_k^4]} \sqrt{E_Z \left[ \sum_{i \neq k} P_{ik}^2 \left( \sum_{j \notin \{i,k\}} P_{kj} \bar{y}_j \right)^2 \right]^2} \right\} \leq \frac{C}{r_n} \rightarrow 0.$$

Then $\hat{\psi}_2 \overset{p}{\rightarrow} 0$ holds by M.

Consider $\hat{\psi}_3$. Note that for $i \neq j \neq k$ and $r \neq s \neq t$ we have $E[\hat{W}_i P_{ik} \hat{\eta}_k P_{kj} \hat{Y}_j \hat{W}_r P_{rs} \hat{\eta}_s P_{st} \hat{Y}_t] = 0$ except when $i = r$ and $j = t$ or $i = t$ and $j = r$. Thus,

$$E[\hat{\psi}_3] = E_Z \left[ \sum_{i \neq j} \left( E[\hat{W}_i^2 | Z] E[\hat{Y}_j^2 | Z] + E[\hat{W}_i \hat{Y}_j | Z] E[\hat{W}_j \hat{Y}_j | Z] \right) \left( \sum_{k \notin \{i,j\}} P_{ik} \hat{\eta}_k P_{kj} \right)^2 \right]$$

$$\leq 2E_Z \left[ \sigma^2 \tilde{W} \sigma^2 \sum_{i \neq j} \left( \sum_{k \notin \{i,j\}} P_{ik} \hat{\eta}_k P_{kj} \right)^2 \right].$$

Note that

$$\sum_{k \notin \{i,j\}} P_{ik} P_{kj} \hat{\eta}_k = \sum_k P_{ik} P_{kj} \hat{\eta}_k - P_{ij} P_{ii} \hat{\eta}_i - P_{ij} P_{jj} \hat{\eta}_j.$$
Note also that

\[
E_Z \left[ \sum_i \left( \sum_k P_{ik} \tilde{\eta}_k P_{ki} \right)^2 \right] = E_Z \left[ \sum_{i,k,\ell} P_{ik}^2 P_{i\ell}^2 \tilde{\eta}_k \tilde{\eta}_\ell \right]
\]

\[
\leq E_Z \left[ \tilde{\mu}^2_\eta \sum_{i,k,\ell} P_{i\ell}^2 \right] = E_Z \left[ \tilde{\mu}^2_\eta \sum_i P_{i}^2 \right] \leq KE_Z \left[ \tilde{\mu}^2_\eta \right],
\]

\[
E_Z \left[ \sum_{i,j} \left( \sum_k P_{ik} \tilde{\eta}_k P_{kj} \right)^2 \right] = E_Z \left[ \sum_{i,j,k,\ell} P_{ik} \tilde{\eta}_k P_{kj} P_{i\ell} \tilde{\eta}_\ell \right]
\]

\[
\leq E_Z \left[ \sum_{k,\ell} \tilde{\eta}_k \tilde{\eta}_\ell \left( \sum_i P_{ik} \right) \left( \sum_j P_{kj} \right) \right]
\]

\[
= E_Z \left[ \sum_{k,\ell} \tilde{\eta}_k \tilde{\eta}_\ell P_{k\ell}^2 \right] \leq E_Z \left[ \tilde{\mu}^2_\eta \sum_{k,\ell} P_{k\ell}^2 \right] = KE_Z \left[ \tilde{\mu}^2_\eta \right].
\]

It therefore follows that

\[
E_Z \left[ \sum_{i \neq j} \left( \sum_k P_{ik} \tilde{\eta}_k P_{kj} \right)^2 \right]
\]

\[
= E_Z \left[ \sum_{i,j} \left( \sum_k P_{ik} \tilde{\eta}_k P_{kj} \right)^2 \right] - E_Z \left[ \sum_{i} \left( \sum_k P_{ik} \tilde{\eta}_k P_{ki} \right)^2 \right] \leq 2KE_Z \left[ \tilde{\mu}^2_\eta \right].
\]

Also, by Lemma B1, \( E_Z \left[ \sum_{i \neq j} P_{ij}^2 P_{jj}^2 \tilde{\eta}_j^2 \right] \leq E_Z \left[ \tilde{\mu}^2_\eta \sum_{i \neq j} P_{ij}^2 \right] \leq KE_Z \left[ \tilde{\mu}^2_\eta \right] \), so that

\[
E_Z \left[ \sum_{i \neq j} \left( \sum_{k \in \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \right)^2 \right]
\]

\[
\leq 3E_Z \left[ \sum_{i \neq j} \left( \sum_{k=1}^n P_{ik} \tilde{\eta}_k P_{kj} \right)^2 + P_{ij}^2 P_{ii}^2 \tilde{\eta}_i^2 + P_{ij}^2 P_{jj}^2 \tilde{\eta}_j^2 \right] \leq 12KE_Z \left[ \tilde{\mu}^2_\eta \right].
\]

From the previous expression for \( E[\hat{\psi}^2_3] \) we then have

\[
E[\hat{\psi}^2_3] \leq \frac{C}{r_n^2} E_Z \left[ \sum_{i \neq j} \left( \sum_{k \notin \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \right)^2 \right] \leq C \left( \frac{K}{r_n^2} \right) E_Z \left[ \tilde{\mu}^2_\eta \right] \leq C \left( \frac{K}{r_n^2} \right) \longrightarrow 0.
\]

Then \( \hat{\psi}_3 \xrightarrow{p} 0 \) by M.

Next, consider \( \hat{\psi}_4 \). Note that for \( i \neq j \neq k \) and \( r \neq s \neq t \) we have \( E[\hat{W}_i P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j \hat{W}_r P_{rs} \tilde{\eta}_s P_{st} \tilde{\eta}_t] = 0 \)
except when $i = r$. Thus,

$$E[\hat{\psi}_A^2] = E_Z \left[ \sum_i E[\hat{W}_i^2 | Z] \left( \sum_{j \neq i} \sum_{k \notin \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j \right)^2 \right]$$

$$\leq E_Z \left[ \sigma_w^2(Z) \sum_i \left( \sum_{j \neq i} \sum_{k \notin \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j \right)^2 \right]$$

$$\leq \frac{C}{r_n} E_Z \left[ \sum_i \left( \sum_{j \neq i} \sum_{k \notin \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j \right)^2 \right].$$

Note that for $i \neq j$,

$$\sum_{k \notin \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j = \sum_k P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j - P_{ii} \tilde{\eta}_i P_{ij} \tilde{\eta}_j - P_{ij} \tilde{\eta}_i P_{jj} \tilde{\eta}_j.$$

Therefore, for fixed $i$,

$$\sum_j \sum_{k \notin \{i,j\}} P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j = \sum_j \left( \sum_k P_{ik} \tilde{\eta}_k P_{kj} \tilde{\eta}_j - P_{ii} \tilde{\eta}_i P_{ij} \tilde{\eta}_j - P_{ij} \tilde{\eta}_i P_{jj} \tilde{\eta}_j \right)$$

$$= \sum_k P_{ik} \tilde{\eta}_k \tilde{\eta}_k - P_{ii} \tilde{\eta}_i \tilde{\eta}_i - \sum_j P_{ij} \tilde{\eta}_j \tilde{\eta}_j - \sum_k P_{ik} \tilde{\eta}_k \tilde{\eta}_k + 2 P_{ii}^2 \tilde{\eta}_i \tilde{\eta}_i.$$

Note that by $P$ idempotent we have

$$E_Z \left[ \sum_j \sum_k P_{jk} \tilde{\eta}_j \tilde{\eta}_j \tilde{\eta}_k \tilde{\eta}_k \right]$$

$$\leq E_Z \left[ \sum_j \eta_j^2 \tilde{\eta}_j \tilde{\eta}_j \right] \leq E_Z \left[ \mu_i^2 \sum_j \eta_j^2 \tilde{\eta}_j \tilde{\eta}_j \right] \leq E_Z \left[ \mu_i^2 \sum_j \eta_j^2 \tilde{\eta}_j \tilde{\eta}_j \right] \leq C E_Z \left[ \tilde{\mu}_i^2 \right] \leq C,$$

where the second to last inequality holds for $n$ sufficiently large since by hypothesis $\sum_j \tilde{\eta}_j^2 \leq C$ a.s. $P_Z$ for large enough $n$. Then, it follows that

$$E_Z \left[ \sum_i \left( \sum_k P_{ik} \tilde{\eta}_k \tilde{\eta}_k \right)^2 \right] = E_Z \left[ \sum_i \sum_j \sum_k P_{ij} \tilde{\eta}_j \tilde{\eta}_j P_{ik} \tilde{\eta}_k \tilde{\eta}_k \right]$$

$$= E_Z \left[ \sum_j \sum_k \tilde{\eta}_j \tilde{\eta}_j \tilde{\eta}_k \tilde{\eta}_k \sum_i P_{ij} P_{ik} \right]$$

$$= E_Z \left[ \sum_j \sum_k P_{jk} \tilde{\eta}_j \tilde{\eta}_j \tilde{\eta}_k \tilde{\eta}_k \right] \leq C.$$
Also, using similar reasoning,

\[
E_Z \left[ \sum_i (P_{ii} \hat{\eta}_i \bar{y}_i)^2 \right] \leq E_Z \left[ \sum_i \hat{\eta}_i^2 y_i^2 \right] \leq E_Z \left[ \bar{\mu}_\eta^2 \sum_i y_i^2 \right] \leq E_Z \left[ \bar{\mu}_\eta^2 \sum_i \bar{y}_i^2 \right] \leq CE_Z \left[ \bar{\mu}_\eta^2 \right] \leq C,
\]

\[
E_Z \left[ \sum_j \left( \sum_i P_{ij} \bar{\eta}_j P_{jj} \bar{y}_j \right)^2 \right] \leq E_Z \left[ \sum_i \hat{\eta}_i^2 P_{ii}^2 \rangle \leq E_Z \left[ \sum_i \hat{\eta}_i^2 \right] \leq E_Z \left[ \bar{\mu}_\eta^2 \sum_i \bar{y}_i^2 \right] \leq C,
\]

\[
E_Z \left[ \sum_i \left( \bar{y}_i \sum_k P_{ik}^2 \hat{\eta}_k \right)^2 \right] \leq E_Z \left[ \sum_i \bar{y}_i^2 \sum_{k,\ell} P_{ik}^2 P_{\ell k}^2 \right] \leq E_Z \left[ \bar{\mu}_\eta^2 \sum_i \bar{y}_i^2 \sum_{k,\ell} P_{ik}^2 P_{\ell k}^2 \right] = E_Z \left[ \bar{\mu}_\eta^2 \sum_i \bar{y}_i^2 \right] \leq C E_Z \left[ \bar{\mu}_\eta^2 \right] \leq C,
\]

\[
E_Z \left[ \sum_i P_{ii}^4 \hat{\eta}_i^2 \bar{y}_i^2 \right] \leq E_Z \left[ \bar{\mu}_\eta^2 \sum_i P_{ii}^4 \rangle \leq E_Z \left[ \bar{\mu}_\eta^2 \sum_i \bar{y}_i^2 \right] \leq C E_Z \left[ \bar{\mu}_\eta^2 \right] \leq C.
\]

Then using the fact that \( (\sum_{r=1}^5 A_r)^2 \leq 5 \sum_{r=1}^5 A_r^2 \) it follows that \( E[\hat{\psi}_4^2] \leq C / r_n \longrightarrow 0 \), so that \( \hat{\psi}_4 \xrightarrow{p} 0 \) by M.

Next, consider \( \hat{\psi}_6 \). Note that for \( i \neq k \),

\[
\sum_{j \notin \{i,k\}} \bar{w}_i P_{ik} P_{kj} \bar{y}_j = \bar{w}_i P_{ik} \bar{y}_k - \bar{w}_i P_{ik}^2 \bar{y}_i - \bar{w}_i P_{ik} P_{kk} \bar{y}_k.
\]

Then for fixed \( k \),

\[
\sum_{i \neq k} \sum_{j \notin \{i,k\}} \bar{w}_i P_{ik} P_{kj} \bar{y}_j = \sum_i (\bar{w}_i P_{ik} \bar{y}_k - \bar{w}_i P_{ik}^2 \bar{y}_i - \bar{w}_i P_{ik} P_{kk} \bar{y}_k) - \bar{w}_k P_{kk} \bar{y}_k + 2 \bar{w}_k P_{kk}^2 \bar{y}_k = \bar{w}_k \bar{y}_k - \sum_i \bar{w}_i P_{ik}^2 \bar{y}_i - \bar{w}_i P_{kk} \bar{y}_k + 2 \bar{w}_k P_{kk}^2 \bar{y}_k,
\]

55
Then using the fact that \((\sum_{r=1}^{5} A_r)^2 \leq 5 \sum_{r=1}^{5} A_r^2\) we have

\[
E[\psi_n^2] = E_Z \left[ \sum_k E \left[ \eta_k^2 | Z \right] \left( \sum_{i \neq k, j \neq (i,k)} \tilde{w}_i P_{ik} P_{kj} \tilde{y}_j \right)^2 \right] \\
\leq 5E_Z \left[ \sigma_n^2 \sum_k \left\{ \tilde{w}_k^2 \tilde{y}_k^2 + \sum_{i,j} P_{kj}^2 \tilde{w}_i \tilde{y}_j \right\} \right] + 5E_Z \left[ \sigma_n^2 \left( \sum_k \tilde{w}_k^2 + \bar{\mu}_Y \sum_i \tilde{y}_i + \bar{\mu}_W \sum_k P_{kk} \tilde{y}_k^2 \right) \right] + 15E_Z \left[ \sigma_n^2 \mu_Y \sum_k \tilde{w}_k^2 \right] \\
\leq 5E_Z \left[ \sigma_n^2 \left( \sum_k \tilde{w}_k^2 + \bar{\mu}_Y \sum_i \tilde{y}_i + \bar{\mu}_W \sum_k P_{kk} \tilde{y}_k^2 \right) \right] + 5KE_Z \left[ \sigma_n^2 \mu_Y \sum_k \tilde{w}_k^2 \right] + 15E_Z \left[ \sigma_n^2 \mu_Y \sum_k \tilde{w}_k^2 \right] \\
\leq 5E_Z \left[ \sigma_n^2 \left( \frac{1}{2} \left( \max_{1 \leq k \leq n} |\tilde{w}_k| \right) + \frac{1}{2} \left( \max_{1 \leq k \leq n} |\bar{\mu}_w| \right) \right) \right] + 5KE_Z \left[ \sigma_n^2 \mu_Y \sum_k \tilde{w}_k^2 \right] \\
+ 15C \sqrt{\frac{E_Z [\sigma_n^2]}{E_Z [\bar{\mu}_Y^2]}} \\
\leq C E_Z \left[ \sigma_n^2 \left( \max_{1 \leq k \leq n} |\tilde{w}_k - \bar{\mu}_w| \right)^2 \right] + C E_Z \left[ \sigma_n^2 \left( \max_{1 \leq k \leq n} |\tilde{w}_k| \right)^2 \right] + o(1) \\
\leq C \sqrt{\frac{E_Z [\sigma_n^2]}{E_Z [\bar{\mu}_Y^2]}} \left[ \left( \frac{1}{\sqrt{n}} \max_{1 \leq k \leq n} |a_i(Z)| \right)^4 \right] + o(1) \\
\leq C \sqrt{\frac{E_Z [\sigma_n^2]}{E_Z [\bar{\mu}_Y^2]}} \left[ \left( \frac{1}{\sqrt{n}} \max_{1 \leq k \leq n} |\tilde{w}_k - \bar{\mu}_w| \right)^4 \right] + o(1)
\]

Now let \(\pi_n \) be such that \(\Delta_n = \max_i |a_i - Z_i \pi_n| \to 0\) \(\text{a.s.}P_Z\), let \(\alpha_n = \pi_n / \sqrt{n}\) and note that \(\max_{1 \leq k \leq n} |\tilde{w}_k - Z_i \alpha_n| = \Delta_n / \sqrt{n} \text{a.s.}P_Z\). Let \(\bar{w} = (\bar{w}_1, ..., \bar{w}_n)^t\). Then,

\[
\max_i |\tilde{w}_i - \bar{w}_i| = \max_i |\tilde{w}_i - Z_i (Z'Z)^{-1} Z' \tilde{w}| = \max_i |\tilde{w}_i - Z_i \alpha_n - Z_i (Z'Z)^{-1} Z'(\tilde{w} - Z \alpha_n)| \leq \Delta_n / \sqrt{n} + \left( \max_i \sum_j P_{ij}^2 \right)^{1/2} \left( \sum_j \max_i |\tilde{w}_i - Z_i \alpha_n| \right)^{1/2} \leq C \Delta_n \to 0 \text{ \(\text{a.s.}P_Z\).}
\]

56
Moreover, note that by Assumption 6, there exists a positive integer \( N \) and a real number \( \epsilon > 0 \) such that

\[
\sup_{n \geq N} E_Z \left( \max_{1 \leq k \leq n} |\hat{w}_k - \bar{w}_k| \right)^{4+\epsilon} \leq C \left[ \sup_{n \geq N} E_Z \left( \max_{1 \leq k \leq n} |\hat{w}_k| \right)^{4+\epsilon} + \sup_{n \geq N} E_Z \left( \max_{1 \leq k \leq n} |\bar{w}_k| \right)^{4+\epsilon} \right]
\]

It, thus, follows by dominated convergence that

\[
E_Z \left( \max_{1 \leq k \leq n} |\hat{w}_k - \bar{w}_k| \right)^{4} \leq CE_Z [\Delta_n^4] \to 0,
\]

so that we have \( E[\hat{\psi}_2^2] \to 0 \); and the desired result follows by T. Q.E.D.
